NEW QUESTION: 1 Refer to the exhibit. Which action completes the configuration to achieve a dynamic continuous mapped NAT for all users?
A. Reconfigure the pool to use the 192.168.1.0 address range
B. Configure a match-host type NAT pool
C. Increase the NAT pool size to support 254 usable addresses
D. Configure a one-to-one type NAT pool
Answer: C

NEW QUESTION: 2 Which flag in a configuration BPDU instructs all switches to shorten their bridge table aging process from the default 300 seconds to the current forward delay value?
A. max-age bit
B. topology change bit
C. priority bit
D. topology change acknowledgment bit
Answer: B
Explanation: The Root Bridge continues to set the Topology Change flag (TCN bit) in all Configuration BPDUs that it sends out for a total of Forward Delay + Max Age seconds (default = 35 (20+15) seconds). This flag instructs all bridges to shorten their MAC address table (Bridge table) aging process from the default value of 300 seconds to the current Forward Delay value of the bridge (default=15 seconds). The TCA flag is set by the upstream bridge to tell the downstream bridges to stop sending TCN BPDUs. The TC flag is set in configuration BPDU by the Root Bridge to shorten the bridge table age-out period from default 300 seconds to Forward Delay seconds.

NEW QUESTION: 3 A survey of passengers on domestic flights revealed these miles:
Miles Flown
Number of Passengers
100 - 499 | 16500 - 8994 | 1900 - 12998 | 11300 - 16991 | 11700 - 20999 | 2100 - 24996
What is the range (in miles)?
A. None of these answers
B. 1,999
C. 2,499
D. 2,399
E. 1,100
Answer: D
Explanation: Explanation/Reference: Explanation: 2499 - 100 = 2399

NEW QUESTION: 4 What are two reasons why broadcast radiation is caused in the virtual machine environment? (Choose two.)
A. The Layer 2 domain can be large in virtual machine environments.
B. vSwitch must interrupt the server CPU to process the broadcast packet.
C. Communication between vSwitch and network switch is broadcast based.
D. Virtual machines communicate primarily through broadcast mode.
E. Communication between vSwitch and network switch is multicast based.
Answer: A, D
Explanation: Explanation Broadcast radiation is the accumulation of broadcast and multicast traffic on a computer network. Extreme amounts of broadcast traffic constitute a broadcast storm. The amount of broadcast traffic you should see within a broadcast domain is directly proportional to the size of the broadcast domain.

Therefore if the layer 2 domain in virtual machine environment is too large, broadcast radiation may occur -> VLANs should be used to reduce broadcast radiation. Also if virtual machines communicate via broadcast too much, broadcast radiation may occur. Another reason for broadcast radiation is using a trunk (to extend VLANs) from the network switch to the physical server. Note about the structure of virtualization in a hypervisor: Hypervisors provide virtual switch (vSwitch) that Virtual Machines (VMs) use to communicate with other VMs on the same host. The vSwitch may also be connected to the host's physical NIC to allow VMs to get layer 2 access to the outside world. Each VM is provided with a virtual NIC (vNIC) that is connected to the virtual switch. Multiple vNICs can connect to a single vSwitch, allowing VMs on a physical host to communicate with one another at layer 2 without having to go out to a physical switch. Although vSwitch does not run Spanning-tree protocol but vSwitch implements other loop prevention mechanisms. For example, a frame that enters from one VMNIC is not going to go out of the physical host from a different VMNIC card.
