**NEW QUESTION: 3** You configure your database Instance to support shared server connections. Which two memory areas that are part of PGA are stored in SGA instead, for shared server connection?**A.** Location of a part of the runtime area for SELECT statements**B.** Stack space**C.** Location of the runtime area for DML and DDL Statements**D.** User session data**E.** Private SQL area**Answer: D, E****Explanation:** Explanation/Reference: Explanation: A: PGA itself is subdivided. The UGA (User Global Area) contains session state information, including stuff like package-level variables, cursor state, etc. Note that, with shared server, the UGA is in the SGA. It has to be, because shared server means that the session state needs to be accessible to all server processes, as any one of them could be assigned a particular session. However, with dedicated server (which likely what you're using), the UGA is allocated in the PGA. C: The Location of a private SQL area depends on the type of connection established for a session. If a session is connected through a dedicated server, private SQL areas are located in the server process' PGA. However, if a session is connected through a shared server, part of the private SQL area is kept in the SGA. Note: \* System global area (SGA) The SGA is a group of shared memory structures, known as SGA components, that contain data and control information for one Oracle Database instance. The SGA is shared by all server and background processes. Examples of data stored in the SGA include cached data blocks and shared SQL areas. \* Program global area (PGA) A PGA is a memory region that contains data and control information for a server process. It is nonshared memory created by Oracle Database when a server process is started. Access to the PGA is exclusive to the server process. There is one PGA for each server process. Background processes also allocate their own PGAs. The total memory used by all individual PGAs is known as the total instance PGA memory, and the collection of individual PGAs is referred to as the total instance PGA, or just instance PGA. You use database initialization parameters to set the size of the instance PGA, not individual PGAs. References:

**NEW QUESTION: 4** DRAG DROP Note: This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is exactly the same in each question in this series. You are a database administrator for a company that has an on-premises Microsoft SQL Server environment and Microsoft Azure SQL Database instances. The environment hosts several customer databases, and each customer uses a dedicated instance. The environments that you manage are shown in the following table. You need to implement a process for importing data into WingDB. Which three actions should you perform

in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order. **Select and Place:** **Answer:** Explanation: Explanation/Reference: Explanation: Step 1: Perform a full backup of the database and enable the bulk-logged recovery model. **Not:** Simple recovery model. With the Simple recovery model we cannot minimize data loss. Step 2: Import the data Step 3: Backup the tail of the transaction log. For databases that use full and bulk-logged recovery, database backups are necessary but not sufficient. Transaction log backups are also required. **Note:** Three recovery models exist: simple, full, and bulk-logged. Typically, a database uses the full recovery model or simple recovery model. A database can be switched to another recovery model at anytime. Reference: <https://docs.microsoft.com/en-us/sql/relational-databases/backup-restore/recovery-models-sql-server>
