NEW QUESTION: 1You have been asked to install and configure a new switch in a customer network. Use the console access to the existing and new switches to configure and verify correct device configuration. Examine the VTP configuration. You are required to configure private VLANs for a new server deployment connecting to the SW4 switch. Which of the following configuration steps will allow creating private VLANs?
A. Disable VTP pruning on New_Switch and SW4 only.
B. Disable VTP pruning on SW1 only.
C. Disable VTP pruning on SW4 only.
D. Disable VTP pruning on SW2, SW4 and New_Switch.
E. Disable VTP pruning on SW2 only.
Answer: C
Explanation: To create private VLANs, you will need to only disable pruning on the switch that contains the private VLANs. In this case, only SW4 will connect to servers in a private VLAN.

NEW QUESTION: 2What is the maximum allowable key size of the Rijndael encryption algorithm?
A. 128 bits
B. 256 bits
C. 512 bits
D. 192 bits
Answer: B
Explanation: The Rijndael algorithm, chosen as the Advanced Encryption Standard (AES) to replace DES, can be categorized as an iterated block cipher with a variable block length and key length that can be independently chosen as 128, 192 or 256 bits. Below you have a summary of the differences between AES and Rijndael. AES is the advanced encryption standard defined by FIPS 197. It is implemented differently than Rijndael: FIPS-197 specifies that the block size must always be 128 bits in AES, and that the key size may be either 128, 192, or 256 bits. Therefore AES-128, AES-192, and AES-256 are actually:

Key Size (bits)	Number of rounds	Block Size (bits)
AES-128	10	128
AES-192	12	128
AES-256	14	128

Some book will say "up to 9 rounds will be done with a 128 bits keys". Really it is 10 rounds because you must include round zero which is the first round. By contrast, the Rijndael specification per se is specified with block and key sizes that may be any multiple of 32 bits, both with a minimum of 128 and a maximum of 256 bits. NEW QUESTION: 3 A network technician has detected duplicate IP addresses on the network. After testing the behavior of rogue DHCP servers, the technician believes that the issue is related to an unauthorized home router. Which of the following should the technician do NEXT in the troubleshooting methodology? **A.** Identify the root cause of the problem. **B.** Document the findings and action taken. **C.** Establish a plan to locate the rogue DHCP server. **D.** Remove the rogue DHCP server from the network. **Answer: C** **Explanation:** Explanation/Reference: Explanation: By testing the behavior of rogue DHCP servers and determining that the issue is related to an unauthorized home router, the technician has completed the third step in the 7-step troubleshooting process. The next step is to establish a plan of action to resolve the problem and identify potential effects. Establishing a plan to locate the rogue DHCP server meets the requirements of this step. 1. Identify the problem. Information gathering. Identify symptoms. Question users. Determine if anything has changed. 2. Establish a theory of probable cause. Question the obvious. Test the theory to determine cause. 3. When the theory is confirmed, determine the next steps to resolve the problem. If theory is not confirmed, re-establish a new theory or escalate. 4. 5. 6. 7. Establish a plan of action to resolve the problem and identify potential effects. Implement the solution or escalate as necessary. Verify full system functionality and if applicable implement preventive measures. Document findings, actions, and outcomes.
