NEW QUESTION: 3

組織は、災害発生時の潜在的なデータ損失を懸念し、緩和戦略としてバックアップデータセンターを作成しました。現在のストレージ方式は、両方のデータセンターのすべてのサーバーで使用される単一のNASです。データセンターに障害が発生した場合に、データの可用性を向上させるオプションは次のうちどれですか？ **A.** NASの変更を他のデータセンターのテープバックアップに複製します。 **B.** 各サーバーに2つのHBAが2つのルートを通じてNASに接続されていることを確認します。 **C.** さまざまなストレージパスにわたって重複排除を確立します。 **D.** データセンター間で複製するSANを確立します。 **Answer: D** Explanation: A SAN is a Storage Area Network. It is an alternative to NAS storage. SAN replication is a technology that replicates the data on one SAN to another SAN; in this case, it would replicate the data to a SAN in the backup datacenter. In the event of a disaster, the SAN in the backup datacenter would contain all the data on the original SAN. Array-based replication is an approach to data backup in which compatible storage arrays use built-in software to automatically copy data from one storage array to another. Array-based replication software runs on one or more storage controllers resident in disk storage systems, synchronously or asynchronously replicating data between similar storage array models at the logical unit number (LUN) or volume block level. The term can refer to the creation of local copies of data within the same array as the source data, as well as the creation of remote copies in an array situated off site.
