**NEW QUESTION: 1**You have an Azure subscription that contains 100 virtual machines.You plan to design a data protection strategy to encrypt the virtual disks.You need to recommend a solution to encrypt the disks by using Azure Disk Encryption. The solution must provide the ability to encrypt operating system disks and data disks.What should you include in the recommendation?**A.** a passphrase**B.** a secret**C.** a certificate**D.** a key**Answer: D****Explanation:** ExplanationFor enhanced virtual machine (VM) security and compliance, virtual disks in Azure can be encrypted. Disks are encrypted by using cryptographic keys that are secured in an Azure Key Vault. You control these cryptographic keys and can audit their use.**Reference:** <https://docs.microsoft.com/en-us/azure/virtual-machines/windows/encrypt-disks>

**NEW QUESTION: 2****A.** Option D**B.** Option B**C.** Option A**D.** Option C**Answer: A**

**NEW QUESTION: 3**Which of the following describe the process identifier that is used to run OSPF on a router? (Choose two.)**A.** It is globally significant.**B.** It is needed to identify a unique instance of an OSPF database.**C.** It is locally significant.**D.** All routers in the same OSPF area must have the same process ID if they are to exchange routing information.**E.** It is an optional parameter required only if multiple OSPF processes are running on the router.**Answer: B,C**

**NEW QUESTION: 4**Which of the following statements is true about data encryption as a method of protecting data?**A.** It requires careful key management**B.** It makes few demands on system resources**C.** It should sometimes be used for password files**D.** It is usually easily administered**Answer: A****Explanation:**In cryptography, you always assume the "bad guy" has the encryption algorithm (indeed, many algorithms such as DES, Triple DES, AES, etc. are public domain). What the bad guy lacks is the key used to complete that algorithm and

encrypt/decrypt information. Therefore, protection of the key, controlled distribution, scheduled key change, timely destruction, and several other factors require careful consideration. All of these factors are covered under the umbrella term of "key management". Another significant consideration is the case of "data encryption as a method of protecting data" as the question states. If that data is to be stored over a long period of time (such as on backup), you must ensure that your key management scheme stores old keys for as long as they will be needed to decrypt the information they encrypted. The other answers are not correct because: "It should sometimes be used for password files." - Encryption is often used to encrypt passwords stored within password files, but it is not typically effective for the password file itself. On most systems, if a user cannot access the contents of a password file, they cannot authenticate. Encrypting the entire file prevents that access. "It is usually easily administered." - Developments over the last several years have made cryptography significantly easier to manage and administer. But it remains a significant challenge. This is not a good answer. "It makes few demands on system resources." - Cryptography is, essentially, a large complex mathematical algorithm. In order to encrypt and decrypt information, the system must perform this algorithm hundreds, thousands, or even millions/billions/trillions of times. This becomes system resource intensive, making this a very bad answer.
