**NEW QUESTION: 1** A gap analysis for Security **A.** refers to the practice of improving the security policies and practices currently in place in your organization designed to protect all your data from unauthorized access alteration or inadvertent disclosure. **B.** refers to the practice of identifying the security policies and practices currently in place in your organization designed to protect all your data from unauthorized access, alteration or inadvertent disclosure. **C.** refers to the practice of modifying the security policies and practices currently in place in your organization designed to protect all your data from unauthorized access, alteration or inadvertent disclosure. **D.** refers to the practice of trusting the security policies and practices currently in place in your organization designed to protect all your data from unauthorized access, alternation or inadvertent disclose. **Answer: A** Explanation: [http://en.wikipedia.org/wiki/Gap\\_analysis](http://en.wikipedia.org/wiki/Gap_analysis) Gap analysis identifies gaps between the optimized allocation and integration of the inputs (resources), and the current allocation level. This reveals areas that can be improved.

**NEW QUESTION: 2** Refer to the exhibit. The following commands are executed on interface fa0/1 of 2950Switch. 2950Switch(config-if)# switchport port-security 2950Switch(config-if)# switchport port-security mac-address sticky 2950Switch(config-if)# switchport port-security maximum 1 The Ethernet frame that is shown arrives on interface fa0/1. What two functions will occur when this frame is received by 2950Switch? (Choose two.) **A.** Only host A will be allowed to transmit frames on fa0/1. **B.** All frames arriving on 2950Switch with a destination of 0000.00aa.aaaa will be forwarded out fa0/1. **C.** Hosts B and C may forward frames out fa0/1 but frames arriving from other switches will not be forwarded out fa0/1. **D.** The MAC address table will now have an additional entry of fa0/1 FFFF.FFFF.FFFF. **E.** Only frames from source 0000.00bb.bbbb, the first learned MAC address of 2950Switch, will be forwarded out fa0/1. **F.** This frame will be discarded when it is received by 2950Switch. **Answer: A, B** Explanation: The first command 2950Switch(config-if)#switchport port-security is to enable the port-security in a switch port. In the second command 2950Switch(config-if)#switchport port-security mac-address sticky, we need to know the full syntax of this command is switchport

port-security mac-address sticky [MAC]. The STICKY keyword is used to make the MAC address appear in the running configuration and you can save it for later use. If you do not specify any MAC addresses after the STICKY keyword, the switch will dynamically learn the attached MAC Address and place it into your running-configuration. In this case, the switch will dynamically learn the MAC address 0000.00aa.aaaa of host A and add this MAC address to the running configuration. In the last command 2950Switch(config-if)#switchport port-security maximum 1 you limited the number of secure MAC addresses to one and dynamically assigned it (because no MAC address is mentioned, the switch will get the MAC address of the attached MAC address to interface fa0/1), the workstation attached to that port is assured the full bandwidth of the port. Therefore only host A will be allowed to transmit frames on fa0/1 -> B is correct. After you have set the maximum number of secure MAC addresses for interface fa0/1, the secure addresses are included in the "Secure MAC Address" table (this table is similar to the Mac Address Table but you can only view it with the show port-security address command). So in this question, although you don't see the MAC address of host A listed in the MAC Address Table but frames with a destination of 0000.00aa.aaaa will be forwarded out of fa0/1 interface -> D is correct.
