**NEW QUESTION: 1** Select the class of Anti-diabetic medication that works in the specified organ to prevent hyperglycemia. Select all that applies. Kidney (G)  
**A.** Sulfonylureas  
**B.** Thiazolidinediones  
**C.** Alpha- Glucosidase Inhibitors  
**D.** Glucagon-like peptide-1 receptor agonists  
**E.** DPP4 Inhibitors  
**F.** Biguanide  
**G.** SGLT2 inhibitors  
**Answer: G**  
**Explanation:** Explanation SGLT2 inhibitors Sulfonylureas work in beta cells in the pancreas that are still functioning to enhance insulin secretion. Alpha-Glucosidase Inhibitors stop -glucosidase enzymes in the small intestine and delay digestion and absorption of starch and disaccharides which lowers the levels of glucose after meals. DPP4 blocks the degradation of GLP-1, GIP, and a variety of other peptides, including brain natriuretic peptide. Glucagon-like peptide-1 receptor agonists work in various organs of the body. Glucagon-like peptide-1 receptor agonists enhance glucose homeostasis through: (i) stimulation of insulin secretion; (ii) inhibition of glucagon secretion; (iii) direct and indirect suppression of endogenous glucose production; (iv) suppression of appetite; (v) enhanced insulin sensitivity secondary to weight loss; (vi) delayed gastric emptying, resulting in decreased postprandial hyperglycaemia. Thiazolidinediones are the only true insulin-sensitising agents, exerting their effects in skeletal and cardiac muscle, liver, and adipose tissue. It ameliorates insulin resistance, decreases visceral fat. Biguanides work in liver, muscle, adipose tissue via activation of AMP-activated protein kinase (AMPK) reduce hepatic glucose production. SGLT2 inhibitors work in the kidneys to inhibit sodium-glucose transport proteins to reabsorb glucose into the blood from muscle cells; overall this helps to improve insulin release from the beta cells of the pancreas.

**NEW QUESTION: 2** Your network contains a server named Server1 that runs Windows Server 2008 R2. You create an ActiveDirectory Lightweight Directory Services (AD LDS) instance on Server1. **A.** Ldp  
**B.** Dsadd  
**C.** Adaminstall  
**D.** Dsmod  
**Answer: A**

**NEW QUESTION: 3** Secure Shell (SSH-2) supports authentication, compression, confidentiality, and integrity, SSH is commonly used as a secure alternative to all of the following protocols below except:  
**A.** rlogin  
**B.** RSH  
**C.** HTTP  
**D.** telnet  
**Answer: C**  
**Explanation:** HTTPS is used for secure web transactions and is not commonly replaced by SSH. Users often want to log on to a remote computer. Unfortunately, most early implementations to meet that need were designed for a trusted network. Protocols/programs, such as TELNET, RSH, and rlogin, transmit unencrypted over the network, which allows traffic to be easily intercepted. Secure shell (SSH) was designed as an alternative to the above insecure protocols and allows users to securely access resources on remote computers over an encrypted tunnel. SSH's services include remotelog-on, file transfer, and command execution. It also supports port forwarding, which redirects other

protocols through an encrypted SSH tunnel. Many users protect less secure traffic of protocols, such as X Windows and VNC (virtual network computing), by forwarding them through a SSH tunnel. The SSH tunnel protects the integrity of communication, preventing session hijacking and other man-in-the-middle attacks. Another advantage of SSH over its predecessors is that it supports strong authentication. There are several alternatives for SSH clients to authenticate to a SSH server, including passwords and digital certificates. Keep in mind that authenticating with a password is still a significant improvement over the other protocols because the password is transmitted encrypted. The following were wrong answers: telnet is an incorrect choice. SSH is commonly used as a more secure alternative to telnet. In fact Telnet should not longer be used today. rlogin is an incorrect choice. SSH is commonly used as a more secure alternative to rlogin. RSH is an incorrect choice. SSH is commonly used as a more secure alternative to RSH. Reference(s) used for this question: Hernandez CISSP, Steven (2012-12-21).
