NEW QUESTION: 2In the VRP interface, use the command startup saved-configuration backup.cfg to configure the startup.cfg file for the next startup.**A. FALSE****B. TRUE****Answer: B**

NEW QUESTION: 3**A.** Option DB. Option CC. Option BD. Option AE. Option EF. Option F

Answer: A,B,FExplanation:The Syslog sender sends a small (less than 1KB) text message to the Syslog receiver.The Syslog receiver is commonly called "syslogd," "Syslog daemon," or "Syslog server." Syslog messages can be sent via UDP (port 514) and/or TCP (typically, port 5000). While there are some exceptions, such as SSL wrappers, this data is typically sent in clear text over the network. A Syslog server provides the storage space necessary to store log files without using router disk space.In general, there are significantly more Syslog messages available within IOS as compared to SNMP Trap messages.For example, a Cisco Catalyst 6500 switch running Cisco IOS Software Release 12.2(18)SXF contains about 90 SNMP trap notification

messages, but has more than 6000 Syslog event messages. System logging is a method of collecting messages from devices to a server running a syslog daemon. Logging to a central syslog server helps in aggregation of logs and alerts. Cisco devices can send their log messages to a UNIX-style syslog service. A syslog service accepts messages and stores them in files, or prints them according to a simple configuration file. Reference:
