The services within the AWS Auto Scaling family include: * Amazon EC2 (known as Amazon EC2 Auto Scaling). * Amazon ECS. * Amazon DynamoDB. * Amazon Aurora. The scaling options define the triggers and when instances should be provisioned/de-provisioned. There are four scaling options: * Maintain - keep a specific or minimum number of instances running. * Manual - use maximum, minimum, or a specific number of instances. * Scheduled - increase or decrease the number of instances based on a schedule. * Dynamic - scale based on real-time system metrics (e.g. CloudWatch metrics). The following table describes the scaling options available and when to use them: The scaling options are configured through Scaling Policies which determine when, if, and how the ASG scales and shrinks. The following table describes the scaling policy types available for dynamic scaling policies and when to use them (more detail further down the page): The diagram below depicts an Auto Scaling group with a Scaling policy set to a minimum size of 1 instance, a desired capacity of 2 instances, and a maximum size of 4 instances: Amazon EC2 Auto Scaling supports sending Amazon SNS notifications when the following events occur.
