NEW QUESTION: 2Your company has a main office, three regional offices, and six branch offices. The network links are configured as shown in the exhibit. (Click the Exhibit button.)The network consists of one Active Directory domain.You create an Active Directory site for each office. You create a site link for each wide areanetwork (WAN) link.The Bridge all site links option is disabled.You need to plan the deployment of domain controllers. The solution must meet the following requirements.Windows PowerShell must be installed on all domain controllers in each regional office.Domain user account passwords stored on the domain controllers must be protected if a branch office domain controller is stolen.What should you do?**A.** In each branch office and in each regional office, install a Server Core installation of Windows Server 2008 and configure a writable domain controller.**B.** In each branch office, install a Server Core installation of Windows Server 2008 and configure a read-only domain controller (RODC). In each regional office, install a full installation of Windows Server 2008 and configure a writable domain controller.**C.** In each branch office and in each regional office, install a full installation of Windows Server 2008 and configure a read-only domain controller (RODC).**D.** In each branch office, install a full installation of Windows Server 2008 and configure a read-only domain controller (RODC). In each regional office, install a Server Core installation of Windows Server 2008 and configure a writable domain controller.**Answer: B****Explanation:** Explanation/Reference: To ensure that the domain user account passwords stored on the domain controllers must be protected if a branch office domain controller is stolen, you need to install a Server Core installation of Windows Server 2008 and configure it as a read-only domain controller (RODC) in each branch office.The Server Core installation of Windows Server 2008 will install only limited services on the RODC, which will store passwords. This installation will be very secure. A Server Core installation provides a minimal environment for running specific server roles, which reduces the maintenance and management requirements and the attack surface for those server roles.Next you can install a full installation of Windows Server 2008 and configure it as a writable domain controller in each regional office firstly because for RODCs to work you need to configure writable domain controllers from where data replication can happen and secondly you need to install them because you need to install Windows

PowerShell on all domain controllers in each regional office. Reference: Server Management / Windows PowerShell

NEW QUESTION: 3 At which stage in the Unity power up sequence would the Storage Processor enter Service mode upon detecting an error?
A. Bootflash
B. After the CMI is started
C. BIOS
D. POST
Answer: D
Explanation: Explanation Note: Boot counters are a troubleshooting mechanism that is designed into the Unity architecture to help pinpoint the specific cause of software or hardware events during the boot sequence. If the Unity system detects a problem with software or hardware components, its corresponding Boot Counter is incremented. If a counter reaches a predefined threshold, the SP boots into Service Mode during its next boot cycle.

NEW QUESTION: 4 **A.** Option **A**. Option **B**. Option **C**. Option **D**. Option **B**
Answer: A
Explanation: Starvation describes a situation where a thread is unable to gain regular access to shared resources and is unable to make progress. This happens when shared resources are made unavailable for long periods by "greedy" threads. For example, suppose an object provides a synchronized method that often takes a long time to return. If one thread invokes this method frequently, other threads that also need frequent synchronized access to the same object will often be blocked.
