NEW QUESTION: 1Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.You have an Azure Data Lake Storage account that contains a staging zone.You need to design a daily process to ingest incremental data from the staging zone, transform the data by executing an R script, and then insert the transformed data into a data warehouse in Azure Synapse Analytics.Solution: You use an Azure Data Factory schedule trigger to execute a pipeline that copies the data to a staging table in the data warehouse, and then uses a stored procedure to execute the R script. Does this meet the goal?**A. No****B. Yes****Answer: B**Explanation:If you need to transform data in a way that is not supported by Data Factory, you can create a custom activity with your own data processing logic and use the activity in the pipeline. You can create a custom activity to run R scripts on your HDInsight cluster with R installed.Reference:

NEW QUESTION: 2A company's website is used to sell products to the public.The site runs on Amazon EC2 instances in an Auto Scaling group behind an Application Load Balancer (ALB). There is also an Amazon CloudFront distribution and AWS WAF is being used to protect against SQL injection attacks.The ALB is the origin for the CloudFront distribution.A recent review of security logs revealed an external malicious IP that needs to be blocked from accessing the website.What should a solutions architect do to protect the application?**A. Modify the security groups for the EC2 instances in the target groups behind the ALB to deny the malicious IP address****B. Modify the network ACL for the EC2 instances in the target groups behind the ALB to deny the malicious IP address****C. Modify the network ACL on the CloudFront distribution to add a deny rule for the malicious IP address****D. Modify the configuration of AWS WAF to add an IP match condition to block the malicious IP address****Answer: D**Explanation:A new version of the AWS Web Application Firewall was released in November 2019. With AWS WAF classic you

create "IP match conditions", whereas with AWS WAF (new version) you create "IP set match statements". Look out for wording on the exam. The IP match condition / IP set match statement inspects the IP address of a web request's origin against a set of IP addresses and address ranges. Use this to allow or block web requests based on the IP addresses that the requests originate from. AWS WAF supports all IPv4 and IPv6 address ranges. An IP set can hold up to 10,000 IP addresses or IP address ranges to check. CORRECT: "Modify the configuration of AWS WAF to add an IP match condition to block the malicious IP address" is the correct answer. INCORRECT: "Modify the network ACL on the CloudFront distribution to add a deny rule for the malicious IP address" is incorrect as CloudFront does not sit within a subnet so network ACLs do not apply to it. INCORRECT: "Modify the network ACL for the EC2 instances in the target groups behind the ALB to deny the malicious IP address" is incorrect as the source IP addresses of the data in the EC2 instances' subnets will be the ELB IP addresses. INCORRECT: "Modify the security groups for the EC2 instances in the target groups behind the ALB to deny the malicious IP address." is incorrect as you cannot create deny rules with security groups.
