Explanation:Explanation/Reference:Explanation:First we should check the routing table of R2 with the "show ip route" command.In this table we cannot find the subnet "10.10.12.0/24" (R3 LAN network) so R2 will use the default route advertised from R1 (with the command "default-information originate" on R1) to reach unknown destination, in this case subnet 10.10.12.0/24 -> R2 will send traffic to 10.10.12.0/24 to R1.Next we need to find out why R3 did not advertise this subnet to R2. A quick check with the "show running- config" on R3 we will see that R3 was not configured with RIP (no "router rip" section). Therefore we can conclude RIPv2 was not enabled on R3.
