NEW QUESTION: 4 You need to design an Azure Synapse Analytics dedicated SQL pool that meets the following requirements: Can return an employee record from a given point in time. Maintains the latest employee information. Minimizes query complexity. How should you model the employee data? **A.** as a SQL graph table **B.** as a degenerate dimension table **C.** as a temporal table **D.** as a Type 2 slowly changing dimension (SCD) table **Answer: D** Explanation: A Type 2 SCD supports versioning of dimension members. Often the source system doesn't store versions, so the data warehouse load process detects and manages changes in a dimension table. In this case, the dimension table must use a surrogate key to provide a unique reference to a version of the dimension member. It also includes columns that define the date range validity of the version (for example, StartDate and EndDate) and possibly a flag column (for example, IsCurrent) to easily filter by current dimension members.
