NEW QUESTION: 1Which type of attack involves hijacking a session between a host and a target by predicting the target's choice of an initial TCP sequence number?**A.** SYN flood attack **B.** Smurf attack**C.** IP spoofing attack**D.** TCP sequence number attack**Answer: D****Explanation:** Explanation/Reference:A TCP sequence number attack exploits the communication session which was established between the target and the trusted host that initiated the session. It involves hijacking the session between the host and the target by predicting the target's choice of an initial TCP sequence number. An IP spoofing attack is used to convince a system that it is communication with a known entity that gives an intruder access. It involves modifying the source address of a packet for a trusted source's address. A SYN attack is when an attacker floods a system with connection requests but does not respond when the target system replies to those requests. A smurf attack occurs when an attacker sends a spoofed (IP spoofing) PING (ICMP ECHO) packet to the broadcast address of a large network (the bounce site). The modified packet containing the address of the target system, all devices on its local network respond with a ICMP REPLY to the target system, which is then saturated with those replies. NEW QUESTION: 3After correctly configuring a new wireless enabled thermostat to control the temperature of the company's meeting room, Joe, a network administrator determines that the thermostat is not connecting to the internet-based control system. Joe verifies that the thermostat received the expected network parameters and it is associated with the AP.

Additionally, the other wireless mobile devices connected to the same wireless network are functioning properly. The network administrator verified that the thermostat works when tested at his residence. Which of the following is the MOST likely reason the thermostat is not connecting to the internet?**A.** the WPA2 shared likely is incorrect**B.** The company implements a captive portal**C.** The company's DHCP server scope is full**D.** The thermostat is using the incorrect encryption algorithm**Answer: A**

NEW QUESTION: 4Given the code fragment:
`List<Person> pList = new CopyOnWriteArrayList<Person>();`
Which statement is true?**A.** Read access to the List should be synchronized.**B.** Person objects retrieved from the List are thread-safe.**C.** A Person object retrieved from the List is copied when written to.**D.** Multiple threads can safely delete Person objects from the List.**E.** Write access to the List should be synchronized.**Answer: B**
Explanation: CopyOnWriteArrayList produces a thread-safe variant of ArrayList in which all mutative operations (add, set, and so on) are implemented by making a fresh copy of the underlying array. Note: this is ordinarily too costly, but may be more efficient than alternatives when traversal operations vastly outnumber mutations, and is useful when you cannot or don't want to synchronize traversals, yet need to preclude interference among concurrent threads. The "snapshot" style iterator method uses a reference to the state of the array at the point that the iterator was created. This array never changes during the lifetime of the iterator, so interference is impossible and the iterator is guaranteed not to throw ConcurrentModificationException. The iterator will not reflect additions, removals, or changes to the list since the iterator was created. Element-changing operations on iterators themselves (remove, set, and add) are not supported. These methods throw UnsupportedOperationException. All elements are permitted, including null. Memory consistency effects: As with other concurrent collections, actions in a thread prior to placing an object into a CopyOnWriteArrayList happen-before actions subsequent to the access or removal of that element from the CopyOnWriteArrayList in another thread.
