NEW QUESTION: 1 Which of the following statements regarding MAC address spoofing attacks is false?
A. Attackers initiate MAC address spoofing attacks using the MAC address learning mechanism
B. When MAC address spoofing attacks occur the switch may sent packets to the attacker
C. Attackers send data frames with forged MAC address to the switch to initiate MAC address spoofing attacks
D. When MAC address spoofing attacks occur the switch may learn incorrect mapping between MAC address and IP addresses
Answer: D

NEW QUESTION: 2 You are designing a virtual network to support a web application. The web application uses Blob storage to store large images. The web application will be deployed to an Azure App Service Web App. You have the following requirements:
* Secure all communications by using Secured Socket layer (SSL)
* SSL encryption and decryption must be processed efficiently to support high traffic load on the web application
* Protect the web application from web vulnerabilities and attacks without modification to backend code
* Optimize web application responsiveness and reliability by routing HTTP request and responses to the endpoint with the lowest network latency for the client.
You need to configure the Azure components to meet the requirements. What should you do? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.
Answer:

Explanation:
Box 1: Azure application Gateway
Azure Application Gateway supports end-to-end encryption of traffic. Application Gateway terminates the SSL connection at the application gateway. The gateway then applies the routing rules to the traffic, re-encrypts the packet, and forwards the packet to the appropriate back-end server based on the routing rules defined. Any response from the web server goes through the same process back to the end user.
Box 2: Azure application Gateway

<https://docs.microsoft.com/en-us/azure/web-application-firewall/ag/ag-overview>
Box 3: Azure Traffic Manager
Azure Traffic Manager is a DNS-based traffic load balancer that enables you to distribute traffic optimally to services across global Azure regions, while providing high availability and responsiveness.

NEW QUESTION: 3 Big Easy Investment Banking, Inc., is participating in an Eastern account underwriting of \$10 million of municipal bonds by agreeing to underwrite 10% of the issue. One week later, \$4 million remains unsold but Big Easy has distributed \$1.5 million of bonds. What is the liability of Big Easy remaining in the account? **A.** \$0 **B.** \$600,000 **C.** \$1,000,000 **D.** \$400,000

Answer: D Explanation: \$400,000. In an Eastern account, liability remains open until the entire syndication is closed. Therefore, Big Easy has a liability for 10% of the unsold portion. Since the unsold portion is \$6 million, the liability for Big Easy is 10% of that amount, which is \$400,000.
