NEW QUESTION: 1ある会社では、Microsoft Flowを使用してタスクを自動化する予定です。各フロータイプをその機能に一致させます。回答するには、適切なフロータイプを左側の列から右側の説明にドラッグします。各オプションは、1回、複数回、またはまったく使用しない場合があります。注：それぞれの正しい一致は1ポイントの価値があります。**Answer:** Explanation: Explanation: Box 1: automated Automated flows start with an event or trigger, such as an email being received. These also support a multitude of actions in the 200+ Flow connectors. Box 2: business process The business process flow that creates stages or screens that enforce a certain sequence of steps. It collects data from users for each step in the stage and can kick off automated workflows. Box 3: scheduled Scheduled flows run regular reports that are sent out to a team and summarize everything that's happened in the past week. This includes everything from simple daily scheduling to more complex scheduling like "every 3rd Monday." Box 4: instant An instant flow is triggered when you click a button inside of the Flow mobile app, SharePoint, Dynamics, PowerApps, or Excel that passes context directly into your flow. Note: There are four different Flow types that you can choose from when starting out. You can create a scheduled flow, automated flow, instant flow, or a business process flow. NEW QUESTION: 2You plan to deploy several Hyper-V hosts that run Windows Server 2016. The deployment will use Software defined Networking (SDN) and VXLAN. Which server role should you install on the network to support the planned deployment? **A.** Host Guardian Service **B.** Network Policy and Access Services **C.** Remote Access **D.** Network Controller **Answer: D** Explanation: References: <https://docs.microsoft.com/en-us/windows-server/networking/sdn/technologies/network-controller/install-the-network-controller-server-role-using-server-manager>

NEW QUESTION: 3You are developing an Azure Cosmos DB solution by using the Azure Cosmos DB SQL API. The data includes millions of documents. Each document may contain hundreds of properties. The properties of the documents do not contain distinct values for partitioning. Azure Cosmos DB must scale individual containers in the database to meet the performance needs of the application by spreading the workload evenly across all partitions over time. You need to select a partition key. Which two partition keys can you use? Each correct answer presents a complete solution. NOTE: Each correct selection is worth one point. **A.** a single property value that does not appear frequently in the documents **B.** a concatenation of multiple property values with a random suffix appended **C.** a single property value that appears frequently in the documents **D.** a value containing the collection name **E.** a hash suffix appended to a property value **Answer: B, E** Explanation: Explanation You can form a partition key by concatenating multiple property values into a single artificial partitionKey property. These

keys are referred to as synthetic keys. Another possible strategy to distribute the workload more evenly is to append a random number at the end of the partition key value. When you distribute items in this way, you can perform parallel write operations across partitions. Note: It's the best practice to have a partition key with many distinct values, such as hundreds or thousands. The goal is to distribute your data and workload evenly across the items associated with these partition key values. If such a property doesn't exist in your data, you can construct a synthetic partition key. References:
