NEW QUESTION: 2Note: This question is part of a series of questions that present the same

Scenario. Each question in the series contains a unique solution that might meet the stated

goals. Some question sets might have more than one correct solution while others might not

have correct solution. Start of Repeated Scenario: You are planning a big data infrastructure by

using an Apache Spark Cluster in Azure HDInsight. The cluster has 24 processor cores and 512

GB of memory. The Architecture of the infrastructure is shown in the exhibit: The architecture

will be used by the following users: * Support analysts who run applications that will use REST

to submit Spark jobs. * Business analysts who use JDBC and ODBC client applications from a

real-time view. The business analysts run monitoring queries to access aggregate result for 15

minutes. The result will be referenced by subsequent queries. * Data analysts who publish

notebooks drawn from batch layer, serving layer and speed layer queries. All of the notebooks

must support native interpreters for data sources that are batch processed. The serving layer

queries are written in Apache Hive and must support multiple sessions. Unique GUIDs are used

across the data sources, which allow the data analysts to use Spark SQL. The data sources in the

batch layer share a common storage container. The Following data sources are used: * Hive for

sales data * Apache HBase for operations data * HBase for logistics data by using a single region

server. End of Repeated scenario. The business analysts report that they experience

performance issues when they run the monitoring queries. You troubleshoot the performance

issues and discover that the intermediate tables generated when the analysts run the queries

cause pressure for the Java Virtual Machine (JVM) garbage collection per job. Which

configuration settings should you modify to alleviate the performance issues? **A.**

spark.sql.files.openCostInBytes **B. spark.sql.inMemoryColumnarStorage.batchSize** **C.**
