NEW QUESTION: 1 A VPC is connected to a company data center by a VPN. An Amazon EC2 instance with the IP address 172.31.16.139 is within a private subnet of the VPC. A SysOps Administrator issued a ping command to the EC2 instance from an on-premises computer with the IP address 203.0.113.12 and did not receive an acknowledgment. VPC Flow Logs were enabled and showed the following: What action will resolve the issue?
A. Modify the VPC network ACL rules to allow inbound traffic from the on-premises computer
B. Modify the EC2 security group rules to allow inbound traffic from the on-premises computer
C. Modify the EC2 security group rules to allow outbound traffic to the on-premises computer
D. Modify the VPC network ACL rules to allow outbound traffic to the on-premises computer
Answer: C

NEW QUESTION: 2 Without validating user input, an application becomes vulnerable to all of the following EXCEPT:
A. Buffer overflow.
B. Command injection.
C. SQL injection.
D. Spear phishing.
Answer: D
Explanation: Input validation is a defensive technique intended to mitigate against possible user input attacks, such as buffer overflows and fuzzing. Input validation checks every user input submitted to the application before processing that input. The check could be a length, a character type, a language type, or a domain.

NEW QUESTION: 3 You set up a SnapMirror relationship between two clusters and start the SnapMirror initialization. The transfer starts without error and begins replicating data. Before the initialization completes, a network failure occurs and the transfer fails to finish. Once the network failure is corrected, you attempt to initialize the transfer again, but receive the following error: Volume rep_vol01 is restricted Which step should you perform before attempting re-initialization?
A. Delete all data in the destination volume.
B. Change the state of the destination volume to online.
C. Change the state of the destination volume to offline.
D.

Delete all Snapshot copies on the destination volume.**Answer: D**

NEW QUESTION: 4An administrator is designing a cluster in a Microsoft Windows environment with three systems. Two of the systems are on the 192.168.4.0 Class C public network. The third system is on the 192.169.0.0 Class B public network. The administrator needs to have Microsoft Windows clients access the service groups independent of the system on which they are running. Which feature or change must be incorporated into the design?**A.** change the servers so they all reside on the same subnet**B.** use the subnet resource in each service group**C.** use the Lanman resource in each service group**D.** change the servers so they all use the same subnet class**Answer: C**
