NEW QUESTION: 1 Which three LSA types are used by OSPFv3? (Choose three.)
A. Intra-Area Prefix LSA
B. Autonomous system external LSA
C. Interarea-prefix LSA for ASBRs
D. Link LSA
E. Internetwork LSA
Answer: A,B,D
Explanation: Link LSA: A router originates a separate Link LSA for each link it is attached to. These LSAs have link-local flooding scope and are never flooded beyond a link that they are associated with. These LSAs have three purposes: -notify the link-local address of the router's interface to the routers attached to the link -inform other routers attached to the link of the list of IPv6 prefixes to associate with the link -allow the router to assert the collection of Option bits to associate with the Network LSA that will be originated for the link. The Link-State ID is set to the Interface ID of link of the originating router.
Intra-Area Prefix LSA: A router uses Intra-Area Prefix LSA to advertise IPv6 prefixes that are associated with
a) the router itself (in IPv4, this was carried in Router LSA)
b) an attached stub network segment (in IPv4, this was carried in Router LSA)
c) an attached transit network segment (in IPv4, this was carried in Network LSA)
A router can originate multiple Intra-Area Prefix LSAs for each router or transit network; each LSA is distinguished by its Link State ID.
AS-External LSA: These LSAs are IPv6 equivalent of IPv4's Type-5 External LSAs. These LSAs are originated by ASBRs describing the destinations external to the AS. Each LSA describe a route to a single IPv6 prefix external to the AS. AS-External LSAs can be used to describe a default route. Default routes are used when no specific route exists for a destination.

NEW QUESTION: 2 Which data modeling language is commonly used by NETCONF?
A. REST
B. YANG
C. XML
D. HTML
Answer: B
Explanation: Explanation Cisco IOS XE supports the Yet Another Next Generation (YANG) data modeling language. YANG can be used with the Network Configuration Protocol (NETCONF) to provide the desired solution of automated and programmable network operations. NETCONF (RFC6241) is an XML-based protocol that client applications use to request information from and make configuration changes to the device. YANG is primarily used to model the configuration and state data used by NETCONF operations.

NEW QUESTION: 3 Which three statements are true about an EtherChannel? (Choose three.)
A. Ports with different spanning-tree path costs can form an EtherChannel.
B. EtherChannel ports in suspended state can receive BPDUs but cannot send them.
C. An EtherChannel forms between trunks that are using different native VLANs.
D. LACP can operate in both half duplex and full duplex, if the duplex setting is the same on both ends.
E. PAGP and LACP can be

configured on the same switch if the switch is not in the same EtherChannel.**Answer: A,B,E**
Explanation:Explanation/Reference:Explanation:Answer A EtherChannel groups running PAgP and LACP can coexist on the same switch or on different switches in the stack. Individual EtherChannel groups can run either PAgP or LACP, but they cannot interoperate.**Answer B:** EtherChannel Member Port StatesPort StatesDescriptionbundledThe port is part of an EtherChannel and can send and receive BPDUs and data traffic.suspendedThe port is not part of an EtherChannel. The port can receive BPDUs but cannot send them. Data traffic is blocked. standaloneThe port is not bundled in an EtherChannel. The port functions as a standalone data port. The port can send and receive BPDUs and data traffic.**Answer E** Ports with different spanning-tree path costs can form an EtherChannel if they are otherwise compatibly configured. Setting different spanning-tree path costs does not, by itself, make ports incompatible for the formation of an EtherChannel.**Reference:**
