IdentityユーザーをCrpafpし、このユーザーにGptOhiprt oprmissinnを割り当てます**Answer: B**

Explanation: All objects and buckets by default are private. The pre-signed URLs are useful if you want your user/customer to be able upload a specific object to your bucket but you don't require them to have AWS security credentials or permissions. When you create a pre-signed URL, you must provide your security credentials, specify a bucket name, an object key, an HTTP method (PUT for uploading objects), and an expiration date and time. The pre-signed URLs are valid only for the specified duration. Option B is invalid because this would be too difficult to implement at a user level. Option C is invalid because this is not possible. Option D is invalid because this is used to serve private content via Cloudfront. For more information on pre-signed urls, please refer to the Link:

<http://docs.aws.amazon.com/AmazonS3/latest/dev/PresignedUrlUploadObject.html> The correct answer is: Generate pre-signed URLs for each user as they request access to protected S3 content. Submit your Feedback/Queries to our Experts
