NEW QUESTION: 2 Users are reporting CPU related performance problems on the virtual machine Email-Prod throughout the day. The resource settings for the VM and the ESXi host the VM is running on are shown below: VM: Email-Prod vCPUs: 4 Memory: 96GB ESXi host: CPU: 2 x 8 Core Processors Memory: 128GB NUMA architecture: E. 2 Nodes Which two options would alleviate the observed performance problem for Email-Prod? (Choose two.) **A.** Enable CPU affinity to bind all vCPUs to one NUMA node. **B.** Enable the advanced parameter Numa.PageMigEnable. **C.** Enable CPU affinity to separate 2 vCPUs for each NUMA node. **D.** Enable the advanced parameter Numa.AutoMemAffinity. **Answer: C, D****Explanation/Reference:** **Explanation: B-** Memory You can change the amount of RAM that a VM will use like this `memsize = "128"` If you don't assign a value for memory VMware will use the default-setting which is 32MB `memsize = "32"` Whenever you assign RAM manually make sure the value is a multiple of 4 - otherwise the VM will not start: `memsize = "255"` causes this error-message: Memory size 255 not a multiple of 4 <https://pubs.vmware.com/vsphere-60/index.jsp#com.vmware.vsphere.hostclient.doc/GUID-99E66B59-53A8-42D0-A08F-17DBE7D4A864.html?resultof=%2522C-> This is expected behavior based on the current architecture of the scheduler. However, these points help to limit the impact of the issue: Lower the number of vCPUs. From the example above, you would lower the number of vCPUs from 8 to 6 or less. If the virtual machines are sized such that they are a whole multiple or divisor of the NUMA node size, this helps with the number of virtual machines that you can power on. If 6 vCPU virtual machines are used, you can run up to at least 8 of those virtual machines (with 100% CPU utilization) without incurring substantial ready times. <https://www.vmware.com/files/pdf/.../VMware-PerfBest-Practices-vSphere6-0.pdf>
