NEW QUESTION: 2After the manifest file has been encrypted, what is the next step in the process?**A.** The manifest file must be validated to ensure that it was encrypted correctly.**B.** The databases must be validated using the "validate manifest.vbs" script.**C.** FTP the encrypted mail files to the IBM SmartCloud data center.**D.** The staging server must be restarted.**Answer: C**

NEW QUESTION: 3Your network contains an Active Directory domain named contoso.com. The domain contains a server named Server1. Server1 has the DHCP Server server role and the Network Policy Server role service installed.Server1 contains three non-overlapping scopes named Scope1, Scope2, and Scope3. Server1 currently provides the same Network Access

Protection (NAP) settings to the three scopes. You modify the settings of Scope1 as shown in the exhibit. (Click the Exhibit button.) You need to configure Server1 to provide unique NAP enforcement settings to the NAP non-compliant DHCP clients from Scope1. What should you create?

A. A connection request policy that has the Service Type condition
B. A network policy that has the Identity Type condition
C. A connection request policy that has the Identity Type condition
D. A network policy that has the MS-Service Class condition

Answer: D

Explanation: MS-Service Class Restricts the policy to clients that have received an IP address from a DHCP scope that matches the specified DHCP profile name. This condition is used only when you are deploying NAP with the DHCP enforcement method. To use the MS-Service Class attribute, in Specify the profile name that identifies your DHCP scope, type the name of an existing DHCP profile. Open the NPS console, double-click Policies, click Network Policies, and then double-click the policy you want to configure. In policy Properties, click the Conditions tab, and then click Add. In Select condition, scroll to the Network Access Protection group of conditions. If you want to configure the Identity Type condition, click Identity Type, and then click Add. In Specify the method in which clients are identified in this policy, select the items appropriate for your deployment, and then click OK. The Identity Type condition is used for the DHCP and Internet Protocol security (IPsec) enforcement methods to allow client health checks when NPS does not receive an Access-Request message that contains a value for the User-Name attribute; in this case, client health checks are performed, but authentication and authorization are not performed. If you want to configure the MS-Service Class condition, click MS-Service Class, and then click Add. In Specify the profile name that identifies your DHCP scope, type the name of an existing DHCP profile, and then click Add. The MS-Service Class condition restricts the policy to clients that have received an IP address from a DHCP scope that matches the specified DHCP profile name. This condition is used only when you are deploying NAP with the DHCP enforcement method.
