NEW QUESTION: 1 Which of the following statements are true about network traffic shaping? (Choose Two.) **A.** The settings affect only outbound traffic. **B.** The settings affect inbound and outbound traffic. **C.** The settings are defined on a per port group basis. **D.** The settings affect only inbound traffic. **Answer: A, C** Explanation: "defined on a per port group basis." could be considered a correct answer because according to the VMware Infrastructure 3: Install and Configure guide, "Traffic shaping may be defined at the virtual switch OR Port Group level." The important distinction here is that they can be defined at this level, but they are APPLIED on a per-virtual machine basis or more directly, to the VM's virtual NIC's.

NEW QUESTION: 2 In OSPF, which LSA type is responsible for pointing to the ASBR router? **A.** type 4 **B.** type 3 **C.** type 1 **D.** type 2 **Answer: A** Explanation: Summary ASBR LSA (Type 4) - Generated by the ABR to describe an ASBR to routers in other areas so that routers in other areas know how to get to external routes through that ASBR. For example, suppose R8 is redistributing external route (EIGRP, RIP...) to R3. This makes R3 an Autonomous System Boundary Router (ASBR). When R2 (which is an ABR) receives this LSA Type 1 update, R2 will create LSA Type 4 and flood into Area 0 to inform them how to reach R3. When R5 receives this LSA it also floods into Area 2. In the above example, the only ASBR belongs to area 1 so the two ABRs (R2 & R5) send LSA Type 4 to area 0 & area 2 (not vice versa). This is an indication of the existence of the ASBR in area 1. Note: + Type 4 LSAs contain the router ID of the ASBR. + There are no LSA Type 4 injected into Area 1 because every router inside area 1 knows how to reach R3. R3 only uses LSA Type 1 to inform R2 about R8 and inform R2 that R3 is an ASBR.
