NEW QUESTION: 1 Examine the following parameters for a database instance: Which three initialization parameters are not controlled by Automatic Shared Memory Management (ASMM)? (Choose three.)
A. DB_KEEP_CACHE_SIZE
B. DB_16K_CACHE_SIZE
C. SORT_AREA_SIZE
D. LOG_BUFFER
E. JAVA_POOL_SIZE
F. STREAMS_POOL_SIZE
Answer: A,B,D
Explanation: Manually Sized SGA Components that Use SGA_TARGET Space SGA Component, Initialization Parameter/ The log buffer LOG_BUFFER/ The keep and recycle buffer caches DB_KEEP_CACHE_SIZE DB_RECYCLE_CACHE_SIZE/ Nonstandard block size buffer caches DB_nK_CACHE_SIZE
Note: * In addition to setting SGA_TARGET to a nonzero value, you must set to zero all initialization parameters listed in the table below to enable full automatic tuning of the automatically sized SGA components. * Table, Automatically Sized SGA Components and Corresponding Parameters

NEW QUESTION: 3 Which three statements about SSHv1 and SSHv2 are true? (Choose three.)
A. Both SSHv1 and SSHv2 require a server key to protect the session key.
B. SSHv2 supports a wider variety of user-authentication methods than SSHv1.
C. Both SSHv1 and SSHv2 support multiple session channels on a single connection.
D. Unlike SSHv1, SSHv2 uses separate protocols for authentication, connection, and transport.
E. Both SSHv1 and SSHv2 negotiate the bulk cipher.
F. Unlike SSHv1, SSHv2 supports multiple forms of user authentication in a single session.
Answer: D,E,F
Explanation: SSH-1 and SSH-2 Differences
SSH-2 SSH-1
Separate transport, authentication, and connection protocols. One monolithic protocol.
Strong cryptographic integrity check. Weak CRC-32 integrity check.
Supports password changing. N/A
Any number of session channels per connection (including none). Exactly one session channel per connection (requires issuing a remote command even when you don't want one).
Full negotiation of modular cryptographic and compression algorithms, including bulk encryption, MAC, and public-key. Negotiates only the bulk cipher; all others are fixed.
Encryption, MAC, and compression are negotiated separately for each direction, with independent keys. The same algorithms and keys are used in both directions (although RC4 uses separate keys, since the algorithm's design demands that keys not be reused).
Extensible algorithm/protocol naming scheme allows local extensions while preserving interoperability. Fixed encoding precludes interoperable additions.
User authentication methods:----public-key (DSA, RSA, OpenPGP) hostbased password (Rhosts dropped due to insecurity)
Supports a wider variety:-----public-key (RSA only) Rhosts RSA password Rhosts (rsh-style) TIS Kerberos
Use of Diffie-Hellman key agreement removes the need for a server key. Server key used for forward secrecy on the session key.
Supports public-key certificates. N/A
User authentication exchange is more flexible and allows requiring multiple forms of authentication for access. Allows exactly one form of authentication per session.
Hostbased authentication is in principle independent of client network address, and so can work with proxying, mobile clients, etc.
Rhosts RSA authentication is effectively tied to the client host address, limiting its usefulness.
Periodic replacement of session keys. N/A
