**NEW QUESTION: 1A** distributed denial of service attack can BEST be described as:**A.** Users attempting to input random or invalid data into fields within a web browser application.**B.** Multiple computers attacking a single target in an organized attempt to deplete its resources.**C.** Invalid characters being entered into a field in a database application.**D.** Multiple attackers attempting to gain elevated privileges on a target system.**Answer: B****Explanation:** Explanation/Reference:Explanation:A Distributed Denial of Service (DDoS) attack is an attack from several different computers targeting a single computer.One common method of attack involves saturating the target machine with external communications requests, so much so that it cannot respond to legitimate traffic, or responds so slowly as to be rendered essentially unavailable. Such attacks usually lead to a server overload.A distributed denial-of-service (DDoS) attack occurs when multiple systems flood the bandwidth or resources of a targeted system, usually one or more web servers. Such an attack is often the result of multiple compromised systems (for example a botnet) flooding the targeted system with traffic. When a server is overloaded with connections, new connections can no longer be accepted. The major advantages to an attacker of using a distributed denial-of-service attack are that multiple machines can generate more attack traffic than one machine, multiple attack machines are harder to turn off than one attack machine, and that the behavior of each attack machine can be stealthier, making it harder to track and shut down.These attacker advantages cause challenges for defense mechanisms. For example, merely purchasing more incoming bandwidth than the current volume of the attack might not help, because the attacker might be able to simply add more attack machines. This after all will end up completely crashing a

website for periods of time. Malware can carry DDoS attack mechanisms; one of the better-known examples of this was MyDoom. Its DoS mechanism was triggered on a specific date and time. This type of DDoS involved hardcoding the target IP address prior to release of the malware and no further interaction was necessary to launch the attack.

**NEW QUESTION: 2** Your company is creating a Java EE corporate wide workflow system in which significant internal business events are consumed by multiple applications. Due to multi-year development plans, many of these applications do not exist yet, even at the design stage. IT has defined standard data formats for these events in the form of small XML documents. Also, the rules for how an application filters and processes events are not fixed in advance and can change over the life of the application. Which combination of technologies is best for distributing and consuming these events throughout the company? **A.** JMS queues and message-driven beans **B.** Remote Method Invocation (RMI) and stateless session beans **C.** HTTP client library and servlets **D.** Relational database and JDBC **E.** Java Message Service (JMS) topics and message-driven beans **Answer: E**

**NEW QUESTION: 3** The In-Memory compression level is set to MEMCOMPRESS FOR QUERY HIGH. For what purpose is this optimized? **A.** for query performance only **B.** for parallel query performance only **C.** for space saving only **D.** for query performance and space saving **E.** for query performance and space saving with greater bias toward space saving **Answer: D**
