NEW QUESTION: 1 Which type of mirroring does SPAN technology perform?
A. Remote mirroring over Layer 2
B. Remote mirroring over Layer 3
C. Local mirroring over Layer 3
D. Local mirroring over Layer 2
Answer: D
Explanation: You can analyze network traffic passing through ports or VLANs by using SPAN or RSPAN to send a copy of the traffic to another port on the switch or on another switch that has been connected to a network analyzer or other monitoring or security device. Local SPAN supports a SPAN session entirely within one switch; all source ports or source VLANs and destination ports are in the same switch or switch stack. Each local SPAN session or RSPAN destination session must have a destination port (also called a monitoring port) that receives a copy of traffic from the source ports or VLANs and sends the SPAN packets to the user, usually a network analyzer: + If ingress traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2. NEW QUESTION: 2 While viewing the ESXi host resource tab, you notice that you have 1 GB of available memory. You attempt to turn on a virtual machine with a 1 GB reservation, and the virtual machine will not power on. What is preventing the virtual machine from powering on?
A. There are too many virtual machines on the host.
B. A CPU reservation was not set.
C. For a virtual machine to start, there must be enough available memory for the reservation and memory overhead.
D. A reservation was set too high.
