NEW QUESTION: 2 Users are reporting CPU related performance problems on the virtual machine Email-Prod throughout the day. The resource settings for the VM and the ESXi host the VM is running on are shown below:
VM: Email-Prod
vCPUs: 4
Memory: 96GB
ESXi host: CPU: 2 x 8 Core Processors
Memory: 128GB
NUMA architecture: E. 2 Nodes
Which two options would alleviate the observed performance problem for Email-Prod? (Choose two.)
A. Enable the advanced parameter Numa.AutoMemAffinity.
B. Enable CPU affinity to bind all vCPUs to one NUMA node.
C. Enable the advanced parameter Numa.PageMigEnable.
D. Enable CPU affinity to separate 2 vCPUs for each NUMA node.

Answer: A, D Explanation: Explanation/Reference: Explanation: B-) Memory You can change the amount of RAM that a VM will use like this memsize = "128" If you don't assign a value for memory VMware will use the default-setting which is 32MB memsize = "32" Whenever you assign RAM manually make sure the value is a multiple of 4 - otherwise the VM will not start: memsize = "255" causes this error-message: Memory size 255 not a multiple of 4 <https://pubs.vmware.com/vsphere-60/index.jsp#com.vmware.vsphere.hostclient.doc/GUID-99E66B59-53A8-42D0-A08F-17DBE7D4A864.html?resultof=%2522C->) This is expected behavior based on the current architecture of the scheduler. However, these points help to limit the impact of the issue : Lower the number of vCPUs. From the example above, you would lower the number of vCPUs from 8 to 6 or less. If the virtual machines are sized such that they are a whole multiple or divisor of the NUMA node size, this helps with the number of virtual machines that you can power on. If 6 vCPU virtual machines are used, you can run up to at least 8 of those virtual machines (with 100% CPU utilization) without incurring substantial ready times. <https://www.vmware.com/files/pdf/.../VMware-PerfBest-Practices-vSphere6-0.pdf>
