NEW QUESTION: 1 Which two statements are true about unicast RPF? (Choose two.)
A. Unicast RPF strict mode works better with multihomed networks.
B. Unicast RPF strict mode supports symmetric paths.
C. Unicast RPF strict mode supports asymmetric paths.
D. Unicast RPF requires CEF to be enabled.
E. CEF is optional with Unicast RPF, but when CEF is enabled it provides better performance.
Answer: B,D
Explanation: Unicast RPF requires Cisco express forwarding (CEF) to function properly on the router. Strict Versus Loose Checking Mode
The Unicast RPF in Strict Mode feature filters ingress IPv4 traffic in strict checking mode and forwards packets only if the following conditions are satisfied. An IPv4 packet must be received at an interface with the best return path (route) to the packet source (a process called symmetric routing). There must be a route in the Forwarding Information Base (FIB) that matches the route to the receiving interface. Adding a route in the FIB can be done via static route, network statement, or dynamic routing. IPv4 source addresses at the receiving interface must match the routing entry for the interface.
