NEW QUESTION: 3 You manage a Microsoft SQL Server instance named SQL1 that has 32 gigabytes (GB) of total memory. The instance supports an app named App1 that only uses a single thread. App1 frequently queries the database using the same index. The operating system and App1 combined require 8 GB of memory to function. You need to ensure that the SQL Server does not limit the performance of App1. What configuration option should you set?
A. max worker threads to 1
B. min memory per query to 4 GB
C. index create memory to 16 GB
D. max server memory to 16 GB
Answer: C Explanation: The index creates memory option controls the maximum amount of memory initially allocated for sort operations when creating indexes. The default value for this option is 0 (self-configuring). If more memory is later needed for index creation and the memory is available, the server will use it; thereby, exceeding the setting of this option. If additional memory is not available, the index creation will continue using the memory already allocated. References:
