A. Audit object access
B. Audit privilege use
C. Audit process tracking
D. Audit policy change
Answer: A
Explanation:

<http://technet.microsoft.com/en-us/library/cc776774%28v=ws.10%29.aspx> Audit object access
This security setting determines whether to audit the event of a user accessing an object—for example, a file, folder, registry key, printer, and so forth—that has its own system access control list (SACL) specified. If you define this policy setting, you can specify whether to audit successes, audit failures, or not audit the event type at all. Success audits generate an audit entry when a user successfully accesses an object that has an appropriate SACL specified. Failure audits generate an audit entry when a user unsuccessfully attempts to access an object that has a SACL specified. Further Information:
