NEW QUESTION: 1You have two computers named Computer1 and Computer2 that run Windows 7.Computer1 has a dynamic disk.You remove the disk from Computer1 and connect the disk to Computer2.You need to ensure that you can open files on all hard disk drives connected to Computer2.What should you do from the Disk Management snap-in?**A.** Import a foreign disk.**B.** Rescan the disks.**C.** Attach a virtual hard disk (VHD).**D.** Convert a disk.**Answer: B**
Explanation:Moving Disks to Another ComputerBefore you move disks to another computer, you should use Disk Management to make sure the status of the volumes on the disks is Healthy. If the status is not Healthy, you should repair the volumes before you move the disks. To verify the volume status, check the Status column in the Disk Management console.Your next step is to uninstall the disks you want to move. In the Computer Management Navigation pane (the left pane), open Device Manager. In the device list, double-click Disk Drives. Right-click each of the disks you want to uninstall in turn and then click Uninstall. In the Confirm Device Removal dialog box, click OK.If the disks that you want to move are dynamic disks, right-click the disks that you want to move in Disk Management, and then click Remove Disk.After you have removed dynamic disks, or if you are moving basic disks, you can disconnect the disk drives physically. If the disks are external, you can now unplug them from the computer. If they are internal, turn off the computer and then remove the disks.If the disks are external, plug them into the destination computer. If the disks are internal, make sure the computer is turned off and then install the disks in that computer. Start the destination computer and follow the instructions on the Found New Hardware dialog box.On the destination computer, open Disk Management, click Action, and then click Rescan Disks. Right-click any disk marked Foreign, click Import Foreign Disks, and then follow the on- screen instructions.<http://technet.microsoft.com/en-us/library/cc753750.aspx>

NEW QUESTION: 2Which private VLAN access port belongs to the primary VLAN and can communicate with all interfaces, including the community and isolated host ports?**A.** promiscuous port**B.** community port**C.** trunk port**D.** isolated port**Answer: A**
Explanation/Reference:Explanation:The types of private VLAN ports are as follows:Promiscuous - A promiscuous port belongs to the primary VLAN. The promiscuous port can communicate with all interfaces, including the community and isolated host ports, that belong to those secondary VLANs associated to the promiscuous port and associated with the primary VLAN. You can have several promiscuous ports in a primary VLAN. Each promiscuous port can have several secondary VLANs, or no secondary VLANs, associated to that port. You can associate a

secondary VLAN to more than one promiscuous port, as long as the promiscuous port and secondary VLANs are within the same primary VLAN. You may want to do this for load-balancing or redundancy purposes. You can also have secondary VLANs that are not associated to any promiscuous port. Isolated - An isolated port is a host port that belongs to an isolated secondary VLAN. This port has complete isolation from other ports within the same private VLAN domain, except that it can communicate with associated promiscuous ports. Private VLANs block all traffic to isolated ports except traffic from promiscuous ports. Traffic received from an isolated port is forwarded only to promiscuous ports. You can have more than one isolated port in a specified isolated VLAN. Each port is completely isolated from all other ports in the isolated VLAN. Community - A community port is a host port that belongs to a community secondary VLAN. Community ports communicate with other ports in the same community VLAN and with associated promiscuous ports. These interfaces are isolated from all other interfaces in other communities and from all isolated ports within the private VLAN domain. Reference:
