Prerequisites for Windows Client Deployment in Configuration Manager - Prerequisites for Computer Clients Installation Method Dependencies Client push installation: Client push installation accounts are used to connect to computers to install the client and are specified on the Accounts tab of the Client Push Installation Properties dialog box. The account must be a member of the local administrators group on the destination computer. If you do not specify a client push installation account, the site server computer account will be used. The computer on which you are installing the client must have been discovered by at least one System Center 2012 Configuration Manager discovery method. The computer has an ADMIN\$ share. Enable client push installation to assigned resources must be selected in the Client Push Installation Properties dialog box if you want to automatically push the System Center 2012 Configuration Manager client to discovered resources. The client computer must be able to contact a distribution point or a management point to download the supporting files. You must have the following security permissions to install the Configuration Manager client by using client push: To configure the Client Push Installation account: Modify and Read permission for the Site object. To use client push to install the client to collections, devices and queries: Modify Resource and Read permission for the Collection object. The Infrastructure Administrator security role includes the required permissions to manage client push installation. Further information:

<http://blogs.technet.com/b/configmgrteam/archive/2011/03/30/active-directory-forestdiscovery-and-publishingin-configuration-manager-2012-beta-2.aspx> Active Directory Forest Discovery and Publishing in Configuration Manager 2012 Beta 2 Forest Discovery and Publishing Overview To improve manageability of an ever-changing network environment, Active Directory Forest Discovery is added in Configuration Manager 2012 Beta 2. With it, Configuration Manager can discover Active Directory forests, their domains, AD Sites and IP subnets. Because domain users (or domain computer accounts) have permission to query forest relationships, Active Directory Forest Discovery can return information about other forests and their trust direction. The system can programmatically connect to all the forests and build a complete mapping of the

corporate environment. It can also cross forest boundaries using specific credentials for each forest regardless of the trust type. The information obtained through Active Directory Forest Discovery can be directly exported as boundaries or boundary groups. Changes to discovered data are updated dynamically and aged out from the database if no longer present in Active Directory Domain Services. The discovered data is also used when clients request a management point or distribution point to ensure they receive the best possible site system. Software update point installation - Installs the client by using the Configuration Manager software updates feature. Group Policy installation - Installs the client by using Windows Group Policy. Logon script installation - Installs the client by using a logon script. Manual installation - Manually installs the client software. Upgrade installation by using application management - Upgrades clients to a newer version by using Configuration Manager application management. You can also use Configuration Manager 2007 software distribution to upgrade clients to System Center 2012 Configuration Manager. Automatic client upgrade Client imaging - Prestages the client installation in an operating system image.

**NEW QUESTION: 3**You have an Exchange Server 2013 organization.You successfully migrate the public folders from a previous version of Exchange Server.You discover that one of the public folder mailboxes almost reached its quota size.You need to move some of the public folders in the public folder mailbox to another public folder mailbox.What should you run?**A. Merge PublicFolderMailbox.ps1B. New-PublicFolderMoveRequestC. Set-MailPublicFolderD. New-PublicFolderMigrationRequestAnswer: B**Explanation:\* If the content of a public folder mailbox begins to exceed your mailbox quotas, you may need to move public folders to a different public folder mailbox. There are a couple ways to do this. To move one or more public folders that don't contain subfolders, you can use thePublicFolderMoveRequest cmdlets.\* Use the New-PublicFolderMoveRequest cmdlet to begin the process of moving public folder contents between public folder mailboxes. Moving public folders only moves the physical contents of the public folder; it doesn't change the logical hierarchy. When the move request is completed, you must run the Remove-PublicFolderMoveRequest cmdlet to remove the request or wait until the time specified in the CompletedRequestAgeLimit parameter has passed. The request must be removed before you can run another move request.
