NEW QUESTION: 2

電子メールユーザーが、会社のセキュリティ組織から送信された電子メールのリンクをクリックするように誘導されました。開いたWebページは安全だと報告していますが、リンクに悪意のあるコードが含まれている可能性があります。どのタイプのセキュリティプログラムが実施されていますか？ **A.** 総当たり攻撃 **B.** ユーザー認識 **C.** ソーシャルエンジニアリング攻撃 **D.** 物理的なアクセス制御

Answer: B Explanation: This is a training program which simulates an attack, not a real attack (as it says "The webpage that opens reports that it was safe") so we believed it should be called a "user awareness" program. Therefore the best answer here should be "user awareness". This is the definition of "User awareness" from CCNA 200-301 Official Cert Guide Book: "User awareness: All users should be made aware of the need for data confidentiality to protect corporate information, as well as their own credentials and personal information. They should also be made aware of potential threats, schemes to mislead, and proper procedures to report security incidents." Note: Physical access control means infrastructure locations, such as network closets and data centers, should remain securely locked.

NEW QUESTION: 4

システム管理者は、Windowsシステムとデータを共有するためにUNIXデバイス上にCIFS共有を確立します。Windowsドメインのセキュリティ認証は最高レベルに設定されています。

Windowsユーザーは、UNIX共有に対して認証できないと述べています。

UNIXサーバー上の次の設定のどれがこの問題を解決しますか？ **A.**

LMを拒否し、NTLMv2のみを受け入れます **B.** NTLMv2を拒否してLMを受け入れる **C.**

LMのみを受け入れる **D.** NTLMのみを受け入れる **Answer: A** Explanation: In a Windows network, NT

LAN Manager (NTLM) is a suite of Microsoft security protocols that provides authentication, integrity, and confidentiality to users. NTLM is the successor to the authentication protocol in Microsoft LAN Manager (LANMAN or LM), an older Microsoft product, and attempts to provide backwards compatibility with LANMAN. NTLM version 2 (NTLMv2), which was introduced in Windows NT 4.0 SP4 (and natively supported in Windows 2000), enhances NTLM security by hardening the protocol against many spoofing attacks, and adding the ability for a server to authenticate to the client. This question states that the security authentication on the Windows domain is set to the highest level. This will be NTLMv2. Therefore, the answer to the question is to allow NTLMv2 which will enable the Windows users to connect to the UNIX server. To improve security, we should disable the old and insecure LM protocol as it is not used by the Windows computers. Incorrect Answers: B: The question states that the security authentication on the Windows domain is set to the highest level. This will be NTLMv2, not LM. C: The question states that the security authentication on the Windows domain is set to the highest level. This will be NTLMv2, not LM so we need to allow NTLMv2. D: The question states that the security authentication on the Windows domain is set to the highest level. This will be NTLMv2, not NTLM (version1).
