NEW QUESTION: 1A. Option CB. Option DC. Option BD. Option A**Answer: C****Explanation:**The SVI interfaces have to fulfill the following general conditions to be up/up:VLAN exists and is in active status on the switch VLAN database.VLAN interface exists on the router and is not administratively down.At least one L2 (access port or trunk) port exists and has a link up on this VLAN. The latest implementation of the autostate feature allows synchronization to Spanning-Tree Protocol (STP) port status.A VLAN interface will be brought up after the L2 port has had time to converge (that is, transition from listening-learning to forwarding). This will prevent routing protocols and other features from using the VLAN interface as if it were fully operational. This also prevents other problems, such as routing black holes, from occurring.At least one L2 (access port or trunk) port is in spanning-tree forwarding state on the VLAN. So for SVI to bring the vlan and line protocol up at least one port in that vlan must be active.
