注：この質問は、同じシナリオを提示する一連の質問の一部です。シリーズの各質問には、述べられた目標を達成する可能性のある独自の解決策が含まれています。一部の質問セットには複数の正しい解決策がある場合がありますが、他の質問セットには正しい解決策がない場合があります。このセクションの質問に回答した後は、その質問に戻ることはできません。その結果、これらの質問はレビュー画面に表示されません。

contoso.localという名前のActiveDirectoryドメインを管理します。Azure AD Connectをインストールし、アカウントを同期せずにcontoso.comという名前のAzure Active Directory (Azure AD) テナントに接続します。

contoso.localドメインにcontoso.comのUPNサフィックスを持つユーザーのみがAzureADに同期するようにする必要があります。

解決策：同期ルールエディターを使用して、同期ルールを作成します。

これは目標を達成していますか？ **A.** はい **B.** いいえ **Answer: A** Explanation: Filtering what objects are synced to Azure AD is a common request and there are many instances where filtering by OU just doesn't cut it. One option is to filter users by their UPN suffix so that only users with the public FQDN as their UPN suffix are synced to Azure AD (e.g., [\[email&#160;protected\]](#) would be synced while [\[email&#160;protected\]](#) would not). Filtering can be configured using either the GUI or PowerShell. Through GUI: Using The Synchronization Rules Editor 1. Open the Synchronization Rules Editor on the server where Azure AD Connect is installed. 2. Click the Add new rule button on the View and manage your synchronization rules window. 3. Fill out the appropriate fields on the Description tab and click Next >. 4. On the Scoping filter tab, click Add group, then Add clause, add a userPrincipalName attribute filter, and click Next >. Attribute: userPrincipalName Operator: ENDSWITH Value: Your internal UPN suffix prefixed with @ (e.g., @internal.acme.com). Users with this UPN suffix will NOT be synced with Office 365. **NEW QUESTION: 2**Note: This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is exactly the same in each question in this series. You maintain a Microsoft SQL Server instance that contains the following databases SalesDb1, SalesDb2, and SalesDb3. Each database has table named Products and Sales. The following table shows the configuration of each database. The backup strategies for each database are described in the following table. Each full or differential backup operation writes into a new file and uses a different sequence number. You observe the following database corruption issues. SalesDb3 reports a number of database corruption issues related to error 823 and 824 when reading data pages. You must display the following information about the corrupted pages: \* database name \* impacted file id \* impacted file physical name \* impacted page id \* event type that identifies the error type \* error count Users report performance issues when they run queries against SalesDb2. You plan to monitor query statistics and execution plans for SalesDb2 by using Query Store. The monitoring strategy must meet the following requirements: \* Perform automatic data cleanup when query store disk usage reaches 500 megabyte (MB). \* Capture queries based on resource consumption. \* Use a stale query threshold value of 60 days. The query optimizer generates suboptimal execution plans for a number of queries on the Sales table in SalesDb2. You will create a maintenance plan that updates statistics for the table. The plan should only update statistics that were automatically created and have not been updated for 30 days. The update should be based on all data in the table. You need to monitor query statistics and execution plans for SalesDb2. Which options should you set for the Query Store configuration? To answer, select the appropriate options in the answer area.

**Answer:** Explanation: Operation Mode: Read-Write Query Store Capture Mode: Auto Size Based Cleanup Mode: AUTO Operation Mode: Read-Write It is strongly recommended to activate size-based cleanup to make sure that Query Store always runs in read-write mode and collects the latest data. Query Store Capture Mode: Auto Auto - Infrequent queries and queries with insignificant compile and execution duration are ignored. Thresholds for execution count, compile and runtime duration are internally determined. Size Based Cleanup Mode: AUTO It is strongly recommended to activate size-based cleanup to make sure that Query Store always runs in read-write mode and collects the latest data. OFF - size based cleanup won't be automatically activated. AUTO - size based cleanup will be automatically activated when size on disk reaches 90% of max\_storage\_size\_mb. This is the default configuration value. Size based cleanup removes the least expensive and oldest queries first. It stops at approximately 80% of max\_storage\_size\_mb.
