NEW QUESTION: 1What does a router do if it has no EIGRP feasible successor route to a destination network and the successor route to that destination network is in active status?**A.** It sends a multicast query packet to all adjacent neighbors requesting available routing paths to the destination network.**B.** It sends a copy of its neighbor table to all adjacent routers.**C.** It routes all traffic that is addressed to the destination network to the interface indicated in the routing table.**D.** It broadcasts Hello packets to all routers in the network to re-establish neighbor adjacencies.**Answer: A****Explanation:**Introduction to EIGRP Reference: http://www.cisco.com/en/US/tech/tk365/technologies_tech_note09186a0080093f07.shtml
Explanation:Feasible SuccessorsA destination entry is moved from the topology table to the routing table when there is a feasible successor. All minimum cost paths to the destination form a set. From this set, the neighbors that have an advertised metric less than the current routing table metric are considered feasible successors.Feasible successors are viewed by a router as neighbors that are downstream with respect to the destination.These neighbors and the associated metrics are placed in the forwarding table.When a neighbor changes the metric it has been advertising or a topology change occurs in the network, the set of feasible successors may have to be re-evaluated. However, this is not categorized as a route recomputation.Route StatesA topology table entry for a destination can have one of two states. A route is considered in the Passive state when a router is not performing a route recomputation. The route is in Active state when a router is undergoing a route recomputation. If there are always feasible successors, a route never has to go into Active state and avoids a route recomputation.When there are no feasible successors, a route goes into Active state and a route recomputation occurs. A route recomputation commences with a router sending a query packet to all neighbors.Neighboring routers can either reply if they have feasible successors for the destination or optionally return a query indicating that they are performing a route recomputation. While in Active state, a router cannot change the next-hop neighbor it is using to forward packets. Once all replies are received for a given query, the destination can transition to Passive state and a new successor can be selected.When a link to a neighbor that is the only feasible successor goes down, all routes through that neighbor commence a route recomputation and enter the Active state.

タイプに関する仮想マシンのIPおよびMAC割り当て要件を説明するステートメント
1ハイパーバイザー？**A.**

各仮想マシンには一意のIPアドレスが必要ですが、MACアドレスは物理サーバーのアドレスと共有されます。B.

各仮想マシンには一意のMACアドレスが必要ですが、物理サーバーとIPアドレスを共有します。C.

各仮想マシンには一意のIPアドレスが必要ですが、MACアドレスを物理サーバーと共有しますD.

各仮想マシンが他のノードに到達できるようにするには、一意のIPアドレスとMACアドレスが必要です。Answer: D

Explanation: A virtual machine (VM) is a software emulation of a physical server with an operating system. From an application's point of view, the VM provides the look and feel of a real physical server, including all its components, such as CPU, memory, and network interface cards (NICs). The virtualization software that creates VMs and performs the hardware abstraction that allows multiple VMs to run concurrently is known as a hypervisor. There are two types of hypervisors: type 1 and type 2 hypervisor. In type 1 hypervisor (or native hypervisor), the hypervisor is installed directly on the physical server. Then instances of an operating system (OS) are installed on the hypervisor. Type 1 hypervisor has direct access to the hardware resources. Therefore they are more efficient than hosted architectures. Some examples of type 1 hypervisor are VMware vSphere/ESXi, Oracle VM Server, KVM and Microsoft Hyper-V. In contrast to type 1 hypervisor, a type 2 hypervisor (or hosted hypervisor) runs on top of an operating system and not the physical hardware directly. answer 'Each virtual machine requires a unique IP and MAC addresses to be able to reach to other nodes' big advantage of Type 2 hypervisors is that management console software is not required. Examples of type 2 hypervisor are VMware Workstation (which can run on Windows, Mac and Linux) or Microsoft Virtual PC (only runs on Windows).
