NEW QUESTION: 1
`public class Calc {public static void main (String [] args) {/** insert code here
Line ** System.out.print("The decimal value is" + var);}}`
A. `double var = 0b10_01D;`
B. `long var = 0b100_01L;`
C. `float var = 0b10_01F;`
D. `int var = 0b_1001;`
E. `float var = 0b10_01;`
F. `double var = 0b10_01;`
Answer: B,E,F
Explanation: B: output 17C: output 9.0E: output 9.0Not A: A _ character cannot begin a number. Not D: A float cannot be defined as a binary number (with literal B) Not F: A float cannot be defined as a decimal number (with literal D) Note 1: In Java SE 7 and later, any number of underscore characters (_) can appear anywhere between digits in a numerical literal. This feature enables you, for example, to separate groups of digits in numeric literals, which can improve the readability of your code. For instance, if your code contains numbers with many digits, you can use an underscore character to separate digits in groups of three, similar to how you would use a punctuation mark like a comma, or a space, as a separator. You can place underscores only between digits; you cannot place underscores in the following places: *At the beginning or end of a number (not A) *Adjacent to a decimal point in a floating point literal *Prior to an F or L suffix *In positions where a string of digits is expected Note 2: An integer literal is of type long if it ends with the letter L or l; otherwise it is of type int. It is recommended that you use the upper case letter L because the lower case letter l is hard to distinguish from the digit 1. Values of the integral types byte, short, int, and long can be created from int literals. Values of type long that exceed the range of int can be created from long literals. Integer literals can be expressed by these number systems: Decimal: Base 10, whose digits consists of the numbers 0 through 9; this is the number system you use every day Hexadecimal: Base 16, whose digits consist of the numbers 0 through 9 and the letters A through F Binary: Base 2, whose digits consists of the numbers 0 and 1 (you can create binary literals in Java SE 7 and later) Reference: The Java Tutorials, Primitive Data Types: Using Underscore Characters in Numeric Literals Integer Literals
