**NEW QUESTION: 3**DRAG DROP You are developing a C# application. The application includes a class named Rate. The following code segment implements the Rate class: You define a collection of rates named rateCollection by using the following code segment: `Collection<Rate> rateCollection = new Collection<Rate>();` The application receives an XML file that contains rate information in the following format: You need to parse the XML file and populate the rateCollection collection with Rate objects. You have the following code: Which code segments should you include in Target 1, Target 2, Target 3 and Target 4 to complete the code? (To answer, drag the appropriate code segments to the correct targets in the answer area. Each code segment may be used once, more than once, or not at all. \* Target 3, Target 4: The following example displays all attributes on the current node.  
`C# VBif (reader.HasAttributes) { Console.WriteLine("Attributes of <" + reader.Name + ">"); while (reader.MoveToNextAttribute()) { Console.WriteLine(" {0}={1}", reader.Name, reader.Value); } // Move the reader back to the element node. reader.MoveToElement(); }`  
The XmlReader.MoveToElement method moves to the element that contains the current attribute node.
