NEW QUESTION: 2 Which of the following packets should NOT be dropped at a firewall protecting an organization's internal network? **A.** Inbound packets with an internal address as the source IP address **B.** Outbound packets with an external destination IP address **C.** Router information exchange protocols **D.** Inbound packets with Source Routing option set **Answer: B**

Explanation: Normal outbound traffic has an internal source IP address and an external destination IP address. Traffic with an internal source IP address should only come from an internal interface. Such packets coming from an external interface should be dropped. Packets with the source-routing option enabled usually indicates a network intrusion attempt. Router information exchange protocols like RIP and OSPF should be dropped to avoid having internal routing equipment being reconfigured by external agents. Source: STREBE, Matthew and PERKINS, Charles, Firewalls 24seven, Sybex 2000, Chapter 10: The Perfect Firewall.

NEW QUESTION: 3 Which VLAN configuration requires switch connectivity defined as an access port? **A.** External Switch Tagging **B.** Private VLAN **C.** Virtual Switch Tagging **D.** Virtual Guest Tagging **Answer: A**

NEW QUESTION: 4

従来の3層トポロジでは、エンジニアはスイッチをルートブリッジとして明示的に構成し、スパニングツリードメインの以降の選択プロセスから除外する必要があります。どのアクションがこのタスクを実行しますか? **A.**

すべてのアクセススイッチポートでルートガードとポートファストを構成します。 **B.**

スパニングツリーの優先度を0に設定します。 **C.**

すべてのスイッチ間接続でBPDUガードを設定します。 **D.**

スパニングツリーの優先度を32768に設定します **Answer: A** Explanation: Explanation Root guard does not allow the port to become a STP root port, so the port is always STP-designated. If a better BPDU arrives on this port, root guard does not take the BPDU into account and elect a new STP root. Instead, root guard puts the port into the root-inconsistent STP state which is equal to a listening state. No traffic is forwarded across this port. Reference:
