Explanation:By using Windows Container-The resources of the applications must be isolated from the physical host (ACHIEVED, as a single container could only access its own resources, but not others)-Each application must be prevented from accessing the resources of the other applications.

(ACHIEVED, as a single container could only access its own resources, but not others)-The configurations of the applications must be accessible only from the operating system that hosts the application. (ACHIEVED, you can use DockerFile or DockerRun to push configurations to containers from the Container Host OS) References:
