As far as the convenience is concerned, the PDF version of our C_S4CFI_2408 exam braindumps plays the most, High quality and Value for the C_S4CFI_2408 Exam:100% Guarantee to Pass Your SAP Certified Associate exam and get your SAP certification.

NEW QUESTION: 1An administrator deployed a linked-clone pool with virtual desktops running Windows XP for a branch office. The Active Directory server supporting the office is a Windows Server 2008 Read Only Domain Controller (RODC). The administrator makes the following changes to Sysprep:-Join the Domain -Use the Virtual Machine name for the NetBIOS nameWhen the administrator attempts to provision the desktops using View Composer, the following error message is displayed:View Composer agent initialization state error (18): Failed to join the domain (waited 565 seconds)What should the administrator do to provision the virtual desktops?**A.** Log in to the parent virtual machine and reinstall the View Agent. Take a new snapshot and recompose the pool.**B.** Configure the desktop pool to use Quickprep instead of Sysprep to provision the Linked Clones.**C.** Configure the virtual desktops to synchronize time from another domain controller that is available on the network.**D.** Log in to the parent virtual machine and apply the RODC compatibility update for XP. Take a new snapshot and recompose the pool.**Answer: D**

NEW QUESTION: 2Which two types of data are backed up by Veritas eDiscovery Platform 8.2? (Choose two.)**A.** Index and Database information**B.** Converted Data**C.** System Statistics and logs**D.** All D: CW folder contents**E.** Case Source Data**Answer: A,C**

NEW QUESTION: 3Note: This question is part of series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated

goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen. Your company has deployed several virtual machines (VMs) on-premises and to Azure. Azure ExpressRoute has been deployed and configured for on-premises to Azure connectivity. Several VMs are exhibiting network connectivity issues. You need to analyze the network traffic to determine whether packets are being allowed or denied to the VMs. Solution: Use Azure Network Watcher to run IP flow verify to analyze the network traffic. Does the solution meet the goal? **A. Yes** **B. No** **Answer: A** Explanation: Explanation The Network Watcher Network performance monitor is a cloud-based hybrid network monitoring solution that helps you monitor network performance between various points in your network infrastructure. It also helps you monitor network connectivity to service and application endpoints and monitor the performance of Azure ExpressRoute. Note: IP flow verify checks if a packet is allowed or denied to or from a virtual machine. The information consists of direction, protocol, local IP, remote IP, local port, and remote port. If the packet is denied by a security group, the name of the rule that denied the packet is returned. While any source or destination IP can be chosen, IP flow verify helps administrators quickly diagnose connectivity issues from or to the internet and from or to the on-premises environment. IP flow verify looks at the rules for all Network Security Groups (NSGs) applied to the network interface, such as a subnet or virtual machine NIC. Traffic flow is then verified based on the configured settings to or from that network interface. IP flow verify is useful in confirming if a rule in a Network Security Group is blocking ingress or egress traffic to or from a virtual machine. References:
