What needs to be done?**A.** VPLEX Witness must exist on an HA ESX Host**B.** The VPLEX Witness server must be placed in a separate failure domain.**C.** VPLEX Witness must exist on an FT ESX Host**D.** VPLEX Witness server must be in a separate cabinet in the same data center.**Answer: B**

NEW QUESTION: 3 Your company plans to deploy an application to the following endpoints:
* Ten virtual machines hosted in Azure
* Ten virtual machines hosted in an on-premises data center environment
All the virtual machines have the Azure Pipelines agent. You need to implement a release strategy for deploying the application to the endpoints. What should you recommend using to deploy the application to the endpoints? To answer, drag the appropriate components to the correct endpoints. Each component may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.**NOTE:** Each correct selection is worth one point.**Answer:** Explanation: Explanation
Box 1: A deployment group
When authoring an Azure Pipelines or TFS Release pipeline, you can specify the deployment targets for a job using a deployment group. If the target machines are Azure VMs, you can quickly and easily prepare them by installing the Azure Pipelines Agent Azure VM extension on each of the VMs, or by using the Azure Resource Group Deployment task in your release pipeline to create a deployment group dynamically.
Box 2: A deployment group

NEW QUESTION: 4 A user has a laptop configured with multiple operating system installations. The operating systems are all installed on a single SSD, but each has its own partition and logical volume. Which of the following is the BEST way to ensure confidentiality of individual operating system data?**A.** Encryption of the SSD at the file level**B.** FDE of the entire SSD as a single disk**C.** FDE of each logical volume on the SSD**D.** Encryption of each individual partition
Answer: D Explanation: In this question, we have multiple operating system installations on a single disk. Some operating systems store their boot loader in the MBR of the disk. However, some operating systems install their boot loader outside the MBR especially when multiple

operating systems are installed. We need to encrypt as much data as possible but we cannot encrypt the boot loaders. This would prevent the operating systems from loading. Therefore, the solution is to encrypt each individual partition separately.
