**NEW QUESTION: 1** Which Control Center Agent collects performance, frame flow, error, and operational statistics for connectivity device ports and generates alerts when specified thresholds are reached? **A.** SDM Agent **B.** Master Agent **C.** FCC Agent **D.** WLA Archiver **Answer: C**

**NEW QUESTION: 2** Which three statements regarding VLANs are true? (Choose three.) **A.** The native VLAN is used for untagged traffic on an 802.1Q trunk. **B.** A VLAN is a broadcast domain. **C.** To create a new VLAN on a Cisco Catalyst switch, the VLAN name, VLAN ID and VLAN type must all be specifically configured by the administrator. **D.** VLANs can be connected across wide-area networks. **E.** Each VLAN must have an SVI configured on the Cisco Catalyst switch for it to be operational. **Answer: A, B, D** **Explanation:** A VLAN can be thought of as a broadcast domain that exists within a defined set of switches. A VLAN consists of a number of end systems, either hosts or network equipment (such as bridges and routers), connected by a single bridging domain. The bridging domain is supported on various pieces of network equipment; for example, LAN switches that operate bridging protocols between them with a separate bridge group for each VLAN. VLANs are created to provide the segmentation services traditionally provided by routers in LAN configurations. VLANs address scalability, security, and network management. Routers in VLAN topologies provide broadcast filtering, security, address summarization, and traffic flow management. None of the switches within the defined group will bridge any frames, not even broadcast frames, between two VLANs. Several key issues described in the following sections need to be considered when designing and building switched LAN internetworks: LAN Segmentation Security Broadcast Control Performance Network Management Communication Between VLANs LAN Segmentation VLANs allow logical network topologies to overlay the physical switched infrastructure such that any arbitrary collection of LAN ports can be combined into an autonomous user group or community of interest. The technology logically segments the network into separate Layer 2 broadcast domains whereby packets are switched between ports designated to be within the same VLAN. By containing traffic originating on a particular LAN only to other LANs in the same VLAN, switched virtual networks avoid wasting bandwidth, a drawback inherent to traditional bridged and switched networks in which packets are often forwarded to LANs with no need for them. Implementation of VLANs also improves scalability, particularly in LAN environments that support broadcast- or multicast-intensive protocols and applications that flood packets throughout the network.

**NEW QUESTION: 3** A cybersecurity analyst was asked to review several results of web vulnerability scan logs. Given the following snippet of code: Which of the following BEST describes the situation and recommendations to be made? **A.** The security analyst has

discovered an embedded iframe pointing to source IP 65.240.22.1 network. Recommend making the iframe visible. Fixing the code will correct the issue. **B.** The security analyst has discovered an embedded iframe that is hidden from users accessing the web page. This code is correct. This is a design preference, and no vulnerabilities are present. **C.** The security analyst has discovered an embedded iframe pointing to source IP 65.240.22.1 network. The link is hidden and suspicious. Recommend the entry be removed from the web page. **D.** The security analyst has discovered an embedded iframe pointing to source IP 65.240.22.1 network. The code should include the domain name. Recommend the entry be updated with the domain name. **Answer: B**
