NEW QUESTION: 4 You have an Azure virtual machine named VM1. The network interface for VM1 is configured as shown in the exhibit. (Click the Exhibit tab.) You deploy a web server on VM1, and then create a secure website that is accessible by using the HTTPS protocol. VM1 is used as a web server only. You need to ensure that users can connect to the website from the internet. What should you do?
A. For Rule5, change the Action to Allow and change the priority to 401.
B. Create a new inbound rule that allows TCP protocol 443 and configure the protocol to have a priority of 501.
C. Modify the protocol of Rule4.
D. Delete Rule1.
Answer: A
Explanation: Explanation Rule 2 is blocking HTTPS access (port 443) and has a priority of 500. Changing Rule 5 (ports 50-5000) and giving it a lower priority number will allow access on port 443. Note: Rules are processed in priority order, with lower numbers processed before higher numbers, because lower numbers have higher priority. Once traffic matches a rule, processing stops.
