NEW QUESTION: 1 Refer to the exhibit. Host A can communicate with Host B but not with Hosts C or D. How can the network administrator solve this problem?
A. Install a second switch and put Hosts C and D on that switch while Hosts A and B remain on the original switch.
B. Install a router and configure a route to route between VLANs 2 and 3.
C. Configure Hosts C and D with IP addresses in the 192.168.2.0 network.
D. Enable the VLAN trunking protocol on the switch.
Answer: B Explanation: Explanation/Reference: Explanation: Two VLANs require a router in between otherwise they cannot communicate through a simple switch mechanism.

NEW QUESTION: 2 Which of the following statements are true about Amazon Route 53 resource records? Choose 2 answers
A. An Amazon Route 53 Alias record can point to any DNS record hosted anywhere.
B. TTL can be set for an Alias record in Amazon Route 53.
C. A CNAME record can be created for your zone apex.
D. An Alias record can map one DNS name to another Amazon Route 53 DNS name.
E. An Amazon Route 53 CNAME record can point to any DNS record hosted anywhere.
Answer: D, E Explanation: Explanation <https://aws.amazon.com/route53/faqs/> Amazon Route 53 offers 'Alias' records (an Amazon Route 53-specific virtual record). Alias records are used to map resource record sets in your hosted zone to Amazon Elastic Load Balancing load balancers, Amazon CloudFront distributions, AWS Elastic Beanstalk environments, or Amazon S3 buckets that are configured as websites. Alias records work like a CNAME record in that you can map one DNS name (example.com) to another 'target' DNS name (elb1234.elb.amazonaws.com).

<http://docs.aws.amazon.com/Route53/latest/DeveloperGuide/resource-record-sets-choosing-alias-non-alias.html> A CNAME record can point to any DNS record hosted anywhere, including to the resource record set that Amazon Route 53 automatically creates when you create a policy record.

NEW QUESTION: 3 In which two cases is it possible to change the protection mode to maximum protection using Enterprise Manager Cloud Control?
A. The primary and standby databases are hosted on different operating systems.
B. A logical standby database is the only standby database in the data guard configuration.
C. Flashback is not enabled for either the primary database, the standby database, or both in the Data Guard configuration.
D. A far sync instance is the only Data Guard configuration member receiving redo in synchronous mode.
E. a snapshot standby database is the only standby database in the Data Guard configuration.

Answer: A, B
