NEW QUESTION: 1 A page application locally stores the same set of codes defined by an used within an external system of record. The Pega application does not locally store the associated to these codes. During case processing, the displayed labels for this set of codes are sourced from the external system of record. On any given data, the label associated to a code may change. You are asked to implement a report definition that display the current label associated to each code whenever the report is run. How do you design a Pega application to meet this requirement? **A.** Query the distinct codes that the report would display. Develop an interface to retrieve the associated labels in bulk. **B.** Display report definition rows using a custom section. Use a keyed-access Data page to source label values. **C.** Develop a SQL function rows that calls a stored procedure to retrieve the currently associated label for each code. **D.** Persist the most recently retrieved label for each code in a table. Join to that table when running the report. **Answer: B**

NEW QUESTION: 2 This is the situation of lead time strategy in case of: **A.** Make-to-stock **B.** None of these **C.** Make-to-order **D.** Engineer-to-order **Answer: D**

NEW QUESTION: 3 **A.** Option B **B.** Option F **C.** Option D **D.** Option C **E.** Option G **F.** Option E **G.** Option A **Answer: A, C, E** Explanation: Explanation: **B:** * A PDB would have its SYSTEM, SYSAUX, TEMP tablespaces. It can also contains other user created tablespaces in it. * There is one default temporary tablespace for the entire CDB. However, you can create additional temporary tablespaces in individual PDBs. **D:** * There is a single redo log and a single control file for an entire CDB * A log switch is the point at which the database stops writing to one redo log file and begins writing to another. Normally, a log switch occurs when the current redo log file is completely filled and writing must continue to the next redo log file. **G:** instance recovery The automatic application of redo log records to uncommitted data blocks when an database instance is restarted after a failure. **Incorrect:** **Not A:** * There is one set of background processes shared by the root and all PDBs. * High consolidation density. The many pluggable databases in a single container database share its memory and background processes, letting you operate many more pluggable databases on a particular platform than you can single databases that use the old architecture. **Not C:** There is a separate SYSAUX tablespace for the root and for each PDB. **Not F:** There is a separate SYSTEM tablespace for the root and for each PDB.
