**NEW QUESTION: 1** Which type of mirroring does SPAN technology perform? **A.** Remote mirroring over Layer 2 **B.** Remote mirroring over Layer 3 **C.** Local mirroring over Layer 3 **D.** Local mirroring over Layer 2 **Answer: D** **Explanation:** You can analyze network traffic passing through ports or VLANs by using SPAN or RSPAN to send a copy of the traffic to another port on the switch or on another switch that has been connected to a network analyzer or other monitoring or security device. Local SPAN supports a SPAN session entirely within one switch; all source ports or source VLANs and destination ports are in the same switch or switch stack. Each local SPAN session or RSPAN destination session must have a destination port (also called a monitoring port) that receives a copy of traffic from the source ports or VLANs and sends the SPAN packets to the user, usually a network analyzer: + If ingress traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2.
