NEW QUESTION: 1You administer a SQL 2012 server that contains a database named SalesDB. SalesDb contains a schema named Customers that has a table named Regions. A user named UserA is a member of a role named Sales. UserA is granted the Select permission on the Regions table. The Sales role is granted the Select permission on the Customers schema. You need to remove the Select permission for UserA on the Regions table. You also need to ensure that UserA can still access all the tables in the Customers schema, including the Regions table, through the Sales role permissions. Which Transact-SQL statement should you use?
A. DENY SELECT ON Schema::Customers FROM Sales
B. REVOKE SELECT ON Object::Regions FROM Sales
C. DENY SELECT ON Object::Regions FROM UserA
D. REVOKE SELECT ON Object::Regions FROM UserA
E. REVOKE SELECT ON Schema::Customers FROM UserA
F. EXEC sp_addrolemember 'Sales', 'UserA'
G. EXEC sp_droprolemember 'Sales', 'UserA'
H. DENY SELECT ON Object::Regions FROM Sales
I. REVOKE SELECT ON Schema::Customers FROM Sales
J. DENY SELECT ON Schema::Customers FROM UserA
Answer: D Explanation: Use REVOKE to remove the grant or deny of a permission.

NEW QUESTION: 2A company has a requirement that only allows specially hardened AMIs to be launched into public subnets in a VPC, and for the AMIs to be associated with a specific security group. Allowing non-compliant instances to launch into the public subnet could present a significant security risk if they are allowed to operate. A mapping of approved AMIs to subnets to security groups exists in an Amazon DynamoDB table in the same AWS account. The company created an AWS Lambda function that, when invoked, will terminate a given Amazon EC2 instance if the combination of AMI, subnet, and security group are not approved in the

DynamoDB table. What should the Solutions Architect do to MOST quickly mitigate the risk of compliance deviations?**A.** Create an Amazon CloudWatch Events rule that matches each time an EC2 instance is launched, and associate it with the Lambda function as the target.**B.** Create an Amazon CloudWatch Events rule that matches each time an EC2 instance is launched using one of the allowed AMIs, and associate it with the Lambda function as the target.**C.** For the Amazon S3 bucket receiving the AWS CloudTrail logs, create an S3 event notification configuration with a filter to match when logs contain the ec2:RunInstances action, and associate it with the Lambda function as the target.**D.** Enable AWS CloudTrail and configure it to stream to an Amazon CloudWatch Logs group. Create a metric filter in CloudWatch to match when the ec2:RunInstances action occurs, and trigger the Lambda function when the metric is greater than 0.**Answer: A**

NEW QUESTION: 4 Using a portable analyzer you perform a packet capture next to a client STA and you can see that the STA is associated to a BSS. You observe the STA sending packets to the AP and the AP sending packets to the STA. Less than 2% of all packets are retransmissions. You move to capture packets by the AP and, while the retry rate is still very low, you now only see unidirectional traffic from the AP to the client. How do you explain this behavior?**A.** The STA is transmitting data using more spatial streams than the portable analyzer can support.**B.** The portable analyzer is too close to the AP causing CCI, blinding the AP to the client's packets.**C.** There is a transmit power mismatch between the client and the AP and while the client can hear the AP's traffic, the AP cannot hear the client.**D.** The portable analyzer has a lower receive sensitivity than the AP and while it can't capture the packets from the client STA, the AP can receive them OK.**Answer: D**
