**NEW QUESTION: 1**Which tool generates alarms based on the thresholds established by integration with other tools?**A.** Tivoli Common Reporting**B.** IBM Tivoli Netcool Manager**C.** IBM Tivoli Monitoring**D.** IBM Tivoli Configuration Manager**Answer: B**

**NEW QUESTION: 2**Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution. Determine whether the solution meets the stated goals.**You need to monitor the environment. You configure System Center Operations Manager 2012 R2 with a web application monitor. Does the solution meet the goal?****A.** No.**B.** Yes.**Answer: B**

**NEW QUESTION: 3**You need to provision the polling data storage account. How should you configure the storage account? To answer, drag the appropriate Configuration Value to the correct Setting. Each Configuration Value may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.**NOTE:** Each correct selection is worth one point.**Answer:** Explanation: Explanation: Account type: StorageV2 You must create new storage accounts as type StorageV2 (general-purpose V2) to take advantage of Data Lake Storage Gen2 features. Scenario: Polling data is stored in one of the two locations: An on-premises Microsoft SQL Server 2019 database named PollingData Azure Data Lake Gen 2 Data in Data Lake is queried by using PolyBase Replication type: RA-GRS Scenario: All services and processes must be resilient to a regional Azure outage. Geo-redundant storage (GRS) is designed to provide at least 99.99999999999999% (16 9's) durability of objects over a given year by replicating your data to a secondary region that is hundreds of miles away from the primary region. If your storage account has GRS enabled, then your data is durable even in the case of a complete regional outage or a disaster in which the primary region isn't recoverable. If you opt for GRS, you have two related options to choose from: GRS replicates your data to another data center in a secondary region, but that data is available to be read only if Microsoft initiates a failover from the primary to secondary region. Read-access geo-redundant storage (RA-GRS) is based on GRS. RA-GRS replicates your data to another data center in a secondary region, and also provides you with the option to read from the secondary region. With RA-GRS, you can read from the secondary region regardless of whether Microsoft initiates a failover from the primary to secondary region. References:
