Answer: A

NEW QUESTION: 2 Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this scenario, you will NOT be able to return to it. As a result, these questions will not appear in the review screen. You are developing a solution that will use Azure Stream Analytics. The solution will accept an Azure Blob storage file named Customers. The file will contain both in-store and online customer details. The online customers will provide a mailing address. You have a file in Blob storage named LocationIncomes that contains based on location. The file rarely changes. You need to use an address to look up a median income based on location. You must output the data to Azure SQL Database for immediate use and to Azure Data Lake Storage Gen2 for long-term retention. Solution: You implement a Stream Analytics job that has one streaming input, one reference input, two queries, and four outputs. Does this meet the goal? **A. Yes B. No Answer: A**
Explanation: Explanation We need one reference data input for LocationIncomes, which rarely changes. We need two queries, one for in-store customers, and one for online customers. For each query two outputs is needed. Note: Stream Analytics also supports input known as reference data. Reference data is either completely static or changes slowly.
